UNIVERSITY CANCER RESEARCH FUND 2018 LEGISLATIVE REPORT

Annual Financial Report to the Joint Legislative Education Oversight Committee
and the Office of State Budget and Management

Submitted November 1, 2018 in accordance with G.S. 116-29.1

www.UNCLineberger.org/ucrf

MESSAGE FROM THE CHAIR

As chair of the Cancer Research Fund Committee overseeing our state's investment in the University Cancer Research Fund (UCRF), I am pleased to share our annual legislative report. This report details the many ways this landmark investment continues to help patients across North Carolina. From underwriting the recruitment, retention and research of faculty who are experts in their fields to supporting innovative technologies extending cancer prevention and therapeutic advances, the UCRF is helping cancer patients and their families in all of our 100 counties.

The UCRF helps spark the life-saving work conducted by researchers at the University of North Carolina at Chapel Hill. Thanks to UCRF support, our researchers are developing better tools and methods to diagnose cancers. They are able to treat tumor cells more precisely and effectively while minimizing harm to nearby healthy cells. This support also includes funding for a growing number of clinical trials, an expanded patient navigation network and large-scale data studies that improve our understanding of cancer. UNC Lineberger Comprehensive Cancer Center, which plays a leadership role in national and international cancer research and treatments, is creating breakthroughs aimed at eradicating cancer thanks to UCRF funding.

The UCRF also helps our faculty members leverage additional funding from other sources. For example, one of our researchers recently received a \$3.7 million grant from the National Cancer Institute's Moon Shot initiative to address colorectal cancer disparities in North Carolina. This builds on the work of the Carolina Cancer Screening Initiative, originally a UCRF-supported program.

In addition to these health and research benefits, the UCRF continues to generate increasing benefits for our state's economy, including:

- Creating an economic impact of \$432 million in North Carolina. This is a return of more than \$9 for every UCRF dollar invested;
- Producing and supporting more than 1,105 jobs in North Carolina and an additional 1,515 jobs through both the indirect and induced impacts of those direct jobs and the spending generated from the UCRF; and
- Attracting \$156.9 million in federal research grants – and \$183.3 in external grants overall – to support UNC Lineberger's research initiatives, and creating nearly \$14.8 million in local and state tax revenue.

Since 2007, the UCRF has been a critical source of support for innovative, meaningful research that produces both health and economic benefits for our state. On behalf of our scientists and clinicians working across North Carolina to improve cancer research and care – and on behalf of all the citizens we serve – we thank you for your ongoing support.

Sincerely,

CAROL L. FOLT, PHD
Chair, Cancer Research Fund Committee

INTRODUCTION

UNIVERSITY CANCER RESEARCH FUND
2018 LEGISLATIVE REPORT

INTRODUCTION

In 2007, the year cancer overtook heart disease as North Carolina's leading cause of death, the North Carolina General Assembly created the University Cancer Research Fund – a landmark investment in cancer research intended to defeat a disease that affects almost 40 percent of North Carolina residents.

The UCRF funds the recruitment, retention and research of UNC faculty members who are world-class experts in their fields. These researchers lead the UNC Lineberger Comprehensive Cancer Center's efforts to better understand, prevent, diagnose, and treat cancer. Additionally, the UCRF supports innovative technologies, infrastructure, basic and patient-oriented research and other core resources that enable UNC Lineberger to help reduce or eliminate the burden cancer can place upon North Carolinians through clinical research and prevention, early detection, and survivorship education.

Given UNC's historical mission of education, research and public service, ensuring that UCRF resources are benefiting patients and communities statewide has been a top priority. UCRF funding has supported research projects, clinical trials, outreach efforts, and community-based interventions that have touched all 100 counties.

Originally funded by a combination of state appropriations, tobacco settlement funds, and taxes on non-cigarette tobacco products such as snuff, the UCRF received \$25 million in 2007 and \$40 million in 2008 before reaching its fully authorized funding amount of \$50 million in 2009. In 2013, the legislature consolidated all earmarked tobacco settlement monies into the General Fund, eliminating one source of UCRF support and thereby reducing the UCRF's funding stream. The portion of UCRF revenue from non-cigarette tobacco product sales has risen over the years. In FY 2018, the state's total allocation to the UCRF was \$47.8 million.

Since 2008, the Cancer Research Fund Committee has published regular reports on the UCRF's supported activities. In 2011, the General Assembly mandated an annual financial report that includes the UCRF's effects on the state's economy, details on expenditures of UCRF monies and outside funds leveraged by UCRF support, and other performance measures.

This is the eighth financial report submitted pursuant to the 2011 legislative requirement. It demonstrates that the University Cancer Research Fund continues to generate significant economic benefits for the state of North Carolina, such as:

- Directly supporting 1,105 research-related employees in FY 2018.
- Creating the equivalent of 1,515 new induced or indirect jobs, based on an independent economic evaluation.

- Having an overall economic impact that increases each year, reaching \$432.2 million in FY 2018.
- Leveraging more than \$183.3 million in outside funding in 2018 that is directly linked to faculty who were recruited or retained by UCRF funds, or attributable to innovation grants, technology and infrastructure investments from the UCRF.
- Generating an increased return on investment each year, exceeding a 9 to 1 return in FY 2018.

In addition to these economic impacts, the UCRF benefits patients and providers in North Carolina, and supports ongoing advancements in cancer research and care. This report details several research and clinical highlights that would not be possible without the UCRF.

The Cancer Research Fund Committee, created by the General Assembly to provide continued oversight and to ensure that UCRF resources are invested responsibly, adopted a Strategic Plan in 2009 to target UCRF resources in areas where they can have maximum impact:

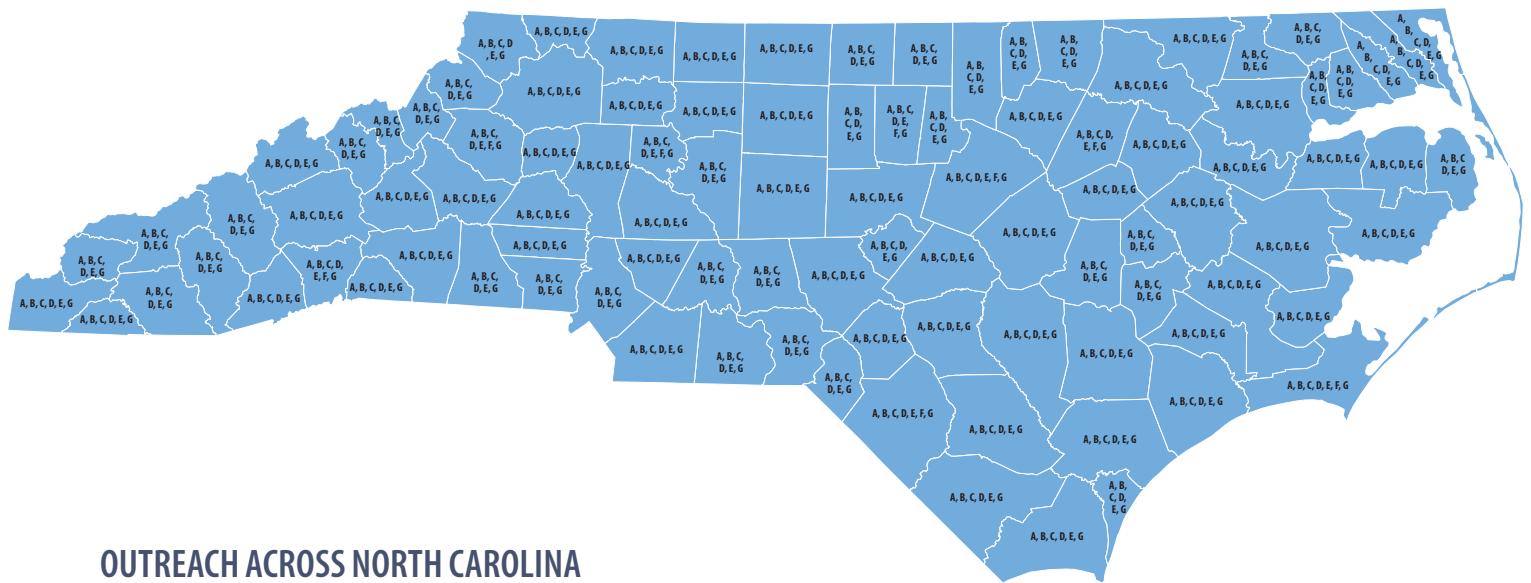

- Strategic research priorities in genetics, novel therapies, and North Carolina cancer outcomes;
- Clinical excellence through selective opportunities that enables UNC to continue to be a leader in a rapidly changing field of research; and
- Critical infrastructure such as technology, training, outreach and other core resources.

A strategic plan refresh in 2014 endorsed and updated these directives. A new plan to guide progress during the next five years has been initiated.

UNC Lineberger has been a National Cancer Institute-designated cancer center for more than 40 years. In 2016 the NCI gave Lineberger an “exceptional” rating – the highest that a cancer center can earn – and cited the UCRF as a significant reason for UNC’s top ranking.

Complementing the UCRF’s significance in ongoing research, infrastructure and public service are the state’s two major capital investments in cancer care. The North Carolina Cancer Hospital, which opened in 2009 and is UNC Lineberger’s clinical home, serves patients from all 100 counties. More than 198,000 patient visits were made to the cancer hospital and its affiliated clinics in FY 2018. Marsico Hall opened in 2014 to serve as a cross-disciplinary collaborative research facility, with cutting-edge equipment and technology that further accelerates research capabilities.

The UCRF has been an important investment that has generated significant economic and health benefits that will only continue to grow as UNC remains a global leader in the fight against cancer.

OUTREACH ACROSS NORTH CAROLINA

A. Cancer Data Resources

- Carolina Breast Cancer Study, Phase 3
- Cancer Information and Population Health Resource (CIPHR) *
- Lung Cancer Screening Registry
- UNC Health Registry *

B. Understanding Cancer Disparities

- Comparative effectiveness of breast cancer screening and diagnostic evaluation by extent of breast density *
- Comparative effectiveness and survivorship health in bladder cancer *
- Economic burden of metastatic breast cancer across life course
- Evaluating the effect of the breast density legislation on supplemental screening
- Geographic Variation of Colorectal Cancer Mortality in North Carolina: A Spatial Analysis Approach
- GMaP: Geographic Management of Cancer Health Disparities Program *
- Healthcare utilization for patients with brain metastases *
- Molecular, treatment and behavioral factors in breast cancer race disparities *
- Racial difference in financial impact of prostate cancer treatment and outcome
- Reproductive health after adolescent and young adult cancer
- Risk-based breast cancer screening and surveillance in community practice *
- Rural/urban and distance to care disparities in stage of diagnosis and treatment of cervical cancer in North Carolina *
- Trends and quality of testicular cancer care in North Carolina *

C. Cancer Screening

- Carolina Cancer Screening Initiative
- Improving targeted colorectal cancer screening in the elderly *
- Mailed reminders plus fecal immunochemical testing (FIT) to increase colorectal cancer screening among patients of Roanoke Chowan Community Health Center
- Randomized trial of a culturally-adapted colorectal cancer screening decision aid designed for American Indians

D. Cancer Survivorship

- Adolescent/Young Adult Horizon Study *
- Efficacy of a couple-focused, tailored, symptom self-management mHealth intervention for prostate cancer patients and partners
- Improving cancer survivorship care across North Carolina: Training group intervention leaders
- mHealth Physical Activity Intervention for survivors of adolescent/young adult cancers

E. Clinic-based Prevention

- My Body My Test
- Normalizing preteen HPV vaccination with practice-based communication strategies *
- Duke – UNC Tobacco Treatment Specialist Credentialing Program

F. Community-based Prevention

- Cancer Conversations
- Communication strategies to increase HPV vaccine intentions
- Get Real & HEEL: Remote Video Participation
- North Carolina BEAUTY and Health Project 2

G. Improving Treatment Outcomes

- ACCURE - Accountability for Cancer Care through Undoing Racism and Equity
- Get Real & HEEL
- Impact of geographic region, treating facility, and physician network characteristics on outcomes for patients with acute leukemia and multiple myeloma in North Carolina *
- NC ProCESS *
- Surgical Treatment of Early-Stage Breast Cancer and the Impact on Cancer-Related Treatment Costs
- Tobacco cessation for cancer patients
- UNC Cancer Network Lay patient navigation program
- UNC Cancer Network Telehealth Lectures *

* All counties

FACULTY IMPACT: RESEARCH AND SERVICE

UNIVERSITY CANCER RESEARCH FUND
2018 LEGISLATIVE REPORT

FACULTY IMPACT: RESEARCH AND SERVICE

Lisa A. Carey, MD, physician-in-chief of the N.C. Cancer Hospital, was appointed to the Susan G. Komen's Scientific Advisory Board. In this position, Carey is responsible for helping guide Komen's \$956 million research program – second only to the U.S. government in funding of breast cancer research. The Richardson and Marilyn Jacobs Preyer Distinguished Professor in Breast Cancer Research at UNC School of Medicine and Division Chief of Hematology and Oncology, Carey is internationally recognized for her research investigating the genetic underpinnings of the molecular subtypes of breast cancer, especially triple negative and HER2-positive breast cancer.

Blossom Damania, PhD, was named a fellow by the American Association for the Advancement of Science, the world's largest general scientific society, in honor of her landmark discoveries and contributions to biomedical sciences in the fields of virology, cancer biology and immunology, involving both basic science and translational research. Damania, co-director of the UNC Lineberger Virology and Global Oncology programs, is the Boshamer Distinguished Professor in the UNC School of Medicine's Department of Microbiology and Immunology, and the school's vice dean for research.

Paul A. Dayton, PhD, a professor in the UNC-Chapel Hill and North Carolina State University Joint Department of Biomedical Engineering, was inducted into the American Institute for Medical Engineering College of Fellows in recognition of his contributions to biomedical engineering in the areas of contrast-enhanced ultrasound imaging and ultrasound-targeted therapeutics. Dayton and his team are researching a non-invasive form of ultrasound technology that can image the abnormal blood vessels feeding tumors. He recently won a \$3 million National Cancer Institute grant to support this research in collaboration with NC State College of Veterinary Medicine.

Joseph DeSimone, PhD, the Chancellor's Eminent Professor of Chemistry in the College of Arts and Sciences at UNC-Chapel Hill and the William R. Kenan, Jr. Distinguished Professor of Chemical Engineering at North Carolina State University, was presented with the 22nd Heinz Award in the Technology, the Economy and Employment category. DeSimone was recognized for his achievements in developing and commercializing advanced technologies in green chemistry, nanoparticle fabrication, precision medicine and 3-D printing.

Gianpietro Dotti, MD, received a grant from the Rivkin Center for Ovarian Cancers to conduct early laboratory studies using genetically engineered immune cells, called T-cells, to treat ovarian cancer, the fifth-deadliest cancer among U.S. women. Dotti, internationally recognized for his design and development of immunotherapeutic approaches to treating cancer, and his colleagues discovered that an antigen is present on most ovarian cancer cells, and they are studying whether they can modify the T cells to recognize the antigen and then direct an attack against the cancer.

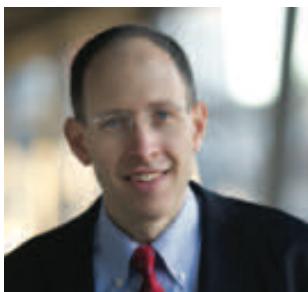

Jack Griffith, PhD, was elected into the National Academy of the Sciences, which is considered one of the highest scientific honors in the United States. Griffith, the Kenan Distinguished Professor in the UNC School of Medicine Department of Microbiology and Immunology and Department of Biochemistry and Biophysics, has conducted extensive research utilizing high-resolution electron microscopy to visualize protein-DNA interactions. His laboratory's work seeks to answer basic questions of how DNA and proteins interact in cancer and other diseases.

Gary Johnson, PhD, received a \$14 million, six-year award from the National Institutes of Health as part of its "Illuminating the Druggable Genome" initiative. This NIH initiative awarded only three grants of this type in 2017. Johnson, the Kenan Distinguished Professor of Pharmacology and former chair of the department, is leading the studies on protein kinases, key regulators of cell function that influence the development of cancer.

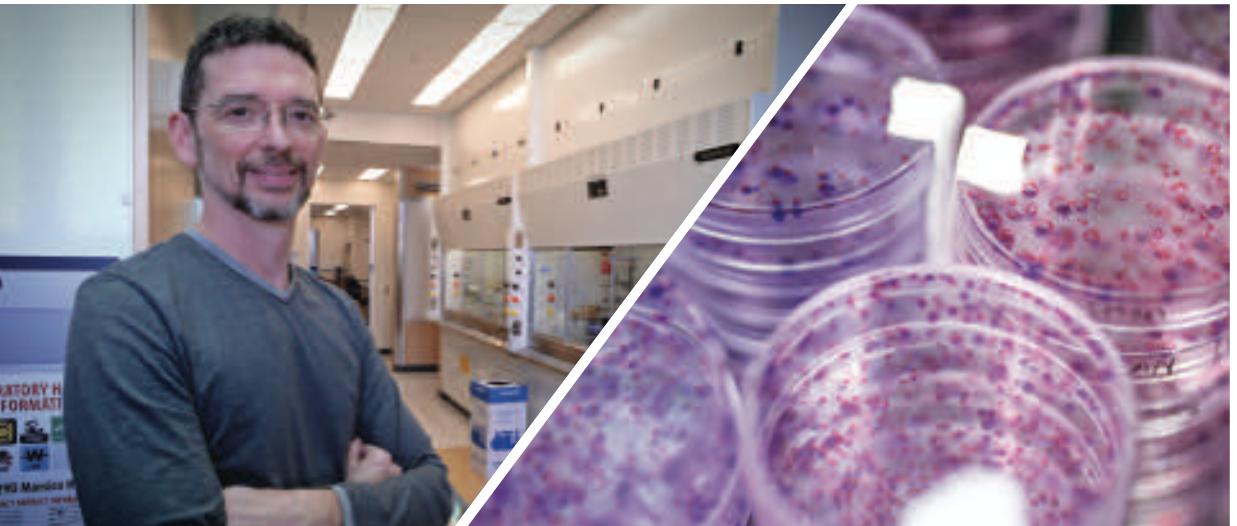

Deborah K. Mayer, PhD, RN, AOCN, FAAN, was appointed to an advisory role with the National Cancer Institute on issues related to cancer survivorship. She will serve as interim director of the NCI's survivorship program for a year. Mayer, director of cancer survivorship at UNC Lineberger and a professor at the School of Nursing, is nationally recognized for her expertise in cancer survivorship research. Mayer is providing insight on current and future research projects with the NCI's Division of Cancer Control and Population Sciences (DCCPS), and will partner with colleagues across DCCPS, the NCI and the National Institutes of Health to address issues in cancer survivorship.

Matthew Milowsky, MD, was elected as co-chair of the Bladder Cancer Task Force of the National Cancer Institute's Genitourinary Cancers Steering Committee, which promotes the best clinical and translational research for patients with genitourinary cancers. Milowsky, co-director of the Urologic Oncology Program and section chief of Genitourinary Oncology at UNC Lineberger and associate professor in medicine at UNC School of Medicine, conducts clinical and translational research, with a particular interest in the design of clinical trials that utilize novel immunotherapies and those that use an integrated genomics approach to guide new therapies.

Donald Rosenstein, MD, was elected president of the American Psychosocial Oncology Society, the only inter disciplinary professional organization in the United States dedicated to psychosocial cancer care, education and research. Rosenstein is director of the UNC Lineberger Comprehensive Cancer Support Program and professor of psychiatry at the UNC School of Medicine.

ECONOMIC IMPACTS

UNIVERSITY CANCER RESEARCH FUND
2018 LEGISLATIVE REPORT

ECONOMIC IMPACTS

To assess whether the UCRF is achieving its goal of stimulating North Carolina's economy, UNC Lineberger again hired Tripp Umbach, a nationally respected consulting firm, to estimate the UCRF's economic impact for Fiscal Year 2018. Tripp Umbach examined the UCRF's immediate impact on state income growth and employment, and the UCRF's overall economic impact was estimated as the sum of its direct and indirect and induced impacts (see the full report in the Appendix). Direct impact resulted from two major sources: expenditures from the UCRF itself, and the expenditure of UCRF-attributable research funds awarded to UNC by federal, foundation and other sources. The indirect and induced impact was calculated by applying standard multipliers to direct expenditures.

For Fiscal Year 2018, UCRF's total allocation was almost \$47.8 million. Using standard methodologies, Tripp Umbach estimated that in FY 2018 the UCRF:

- Had an overall economic impact of \$432.2 million, including \$231.1 million in direct spending and \$201.1 million in indirect and induced impact attributable to external grant funding and downstream spending by employees, vendors and contractors.
- Generated more than \$9 in economic impact for every UCRF dollar expended.
- Supported more than 2,620 jobs, including the direct support of 1,105 jobs and an additional 1,515 jobs through the increased extramural funding and the indirect and induced impacts of those direct jobs and the spending generated within North Carolina.
- Resulted in nearly \$14.8 million in state and local tax revenues to North Carolina.

Tripp Umbach has been used for the UCRF economic analysis since FY 2013. Prior to that, economic impact analyses were performed by SRA International and the UNC Center for Competitive Economies (Frank Hawkins Kenan Institute of Private Enterprise) using slightly different methodologies. The FY 2018 amount brings the total economic impact of the UCRF since its inception to more than \$2.8 billion.

Faculty Job Creation and Retention

Great faculty are at the core of the UCRF's successes. They spearhead the groundbreaking research that leads to important advancements in cancer treatment, prevention and early detection. They also hire staff, train students and fellows, purchase equipment, and earn research funding from other sources both inside and outside North Carolina. Since the UCRF was created in 2007, it has had a tremendous positive impact on cancer research faculty:

- **Recruitment:** The UCRF has supported the recruitment of 16 faculty this year, and 201 since its creation. These faculty are developing a wide range of research programs in cancer genomics, nanomedicine, quantitative biology, health outcomes, multiple cancer types, health communications, and other areas critical to improving cancer prevention, diagnosis and treatment in our state.
- **Retention:** UCRF support has enabled the retention of 7 UNC faculty this year, and 48 since its inception, allowing top talent to stay at UNC where they can continue their research and clinical care.

Extramural Funding Growth

Almost all extramural funds come to UNC from outside North Carolina, adding significantly to the state's economy. The UCRF's Strategic Plan establishes extramural research funding – particularly competitive federal funding – as a key measure for UCRF success. UCRF support is keeping the state at the forefront of research nationally and leveraging significant amounts of extramural research funds for North Carolina.

Faculty members have used UCRF support to underwrite research, and they have leveraged the findings from those studies to generate additional funding from outside sources. For example, Andrew Wang, MD, whose research has been supported by the UCRF, recently received a prestigious four-year, \$2.09 million UNC Research Opportunities Initiative grant from the UNC system to support his work investigating pharmacoengineering approaches to enhance the immune response to neoantigens. And Daniel Reuland, MD, received an Accelerating Colorectal Cancer Screening and Follow-Up Through Implementation Science grant, which will provide \$3.7 million over five years from the National Cancer Institute's Moon Shot Initiative. Reuland will use the grant to launch a project to address colorectal cancer disparities in North Carolina, building on the work of the UCRF-supported Carolina Cancer Screening Initiative.

FY 2018 funding from outside sources that is directly attributable to the UCRF totaled \$183.3 million in annual total cost dollars. A complete list of the awards is included in the Appendix.

Intellectual Property, Innovation, and Entrepreneurship

By encouraging research innovation, the UCRF has promoted entrepreneurship and has created jobs and spinoff companies. The UCRF collaborates with UNC's North Carolina Translational and Clinical Sciences Institute to emphasize an entrepreneurial mindset at UNC, and supports specialized staff to maximize the development and licensing of university intellectual property. More than 45 startup companies have launched or expanded their reach thanks to the UCRF. These companies, including G1 Therapeutics, Genecentric, EpiCypher, Epizyme, and Liquidia, to name a few, are attracting external grant support, drawing venture capital investments, and creating private-sector jobs as a result. Since 2009, UNC Lineberger startup companies have raised more than \$300 million from the National Institutes of Health, angel investors, and venture capitalists.

RESEARCH IMPACTS

UNIVERSITY CANCER RESEARCH FUND
2018 LEGISLATIVE REPORT

RESEARCH IMPACTS

Our faculty are the key to UNC Lineberger's national leadership in cancer research. Lineberger faculty and staff not only lead a variety of cutting-edge treatment and research efforts based at our clinical home in Chapel Hill – they also are partnering with hospitals, clinics and public health organizations in all 100 North Carolina counties to improve cancer outcomes across the state through better cancer screenings, survivorship support, and community-based prevention. They strive to improve treatment outcomes for all patients and reduce cancer disparities that are caused by barriers to care and other factors.

UNC Lineberger has been a National Cancer Institute-designated cancer center for more than 40 years. In 2016, the NCI awarded Lineberger an “exceptional” rating – the highest a cancer center can earn – and cited the UCRF as a significant reason.

The Cancer Research Fund Committee adopted a Strategic Plan in 2009 to guide the most effective and responsible use of the state’s investment. This section of the annual report highlights some of our successes in each of the Strategic Plan’s primary areas.

Research Priorities

The Plan prioritizes UCRF resources by targeting three specific research priorities where – with focused investment in major scientific programs, disease-based initiatives, or cutting-edge research platforms – UNC Lineberger could have meaningful impact and become a world leader:

- **Understanding the Role of Genetics in Cancer Causation and Treatment:** to discover the genes that predispose families to cancer and that predispose cancer patients to poor treatment outcomes – especially by looking for the various genetic mutations in specific cancer subtypes that lead to cancer therapy failure.
- **Developing Novel Therapeutics:** to devise new therapies that are targeted to the specific vulnerabilities of treatment-resistant cancers, and to develop new ways of delivering treatments that reduce toxic side effects for patients. This research priority relates closely to the genetics initiative, and makes key observations that will be utilized in clinical applications as quickly as possible. It also dramatically expanded UNC Lineberger’s ability to take a national leadership role in the investigation and development of innovative, first-in-class immunotherapy approaches to cancers that failed to respond to standard therapies.
- **Optimizing NC Cancer Outcomes:** to enhance the quality of oncology and survivor care, and to build population-based datasets that track the occurrence and treatment of cancer across North Carolina in order to support research designed to improve community prevention, early detection and access to modern therapy. The ultimate goal is to understand North Carolina’s cancer problem at a level unprecedented in the nation and to design research interventions aimed at rectifying these problems at the practice, health system and community levels.

Clinical Excellence and Infrastructure

Because the Cancer Research Fund Committee recognized the need for UNC Lineberger to be able to adapt to a rapidly changing field, the Strategic Plan highlighted the importance of establishing critical infrastructure and pursuing selective opportunities, outside of the three general research priorities, where UNC Lineberger could strive for clinical excellence and have a major impact.

This approach allows the UCRF to seize research or clinical opportunities as they arise and to provide the top minds in the field with the resources they need. Examples include seed funds to recruit top researchers; support of technology and equipment for use by multiple faculty members; competitive, innovative pilot projects; and the development of shared research resources. Thanks to the UCRF, UNC Lineberger has been able to recruit, retain and support outstanding faculty members with expertise and leadership in key clinical areas.

Investments in imaging, informatics and fundamental research techniques have given our clinician scientists the tools they need to improve patient outcomes, while virtual tumor boards and telemedicine connect doctors and hospitals across the state with UNC Lineberger's oncology experts. The UCRF provides the opportunity to grow our multidisciplinary excellence in cancer care and to develop a statewide infrastructure that helps bring leading-edge clinical research and applications into community engaged practices and research institutions across North Carolina.

RESEARCH PRIORITY 1: GENETICS IN CANCER CAUSATION AND TREATMENT

Unprecedented genetics collaboration yields key discoveries

UNC Lineberger's role as a leader in The Cancer Genome Atlas (TCGA), a large-scale collaborative effort to analyze more than 10,000 different tumor samples in order to gain a better understanding of cancer genomics, has put UNC Lineberger researchers at the national forefront of many new revelations about how genetic changes influence the growth and spread of various cancers.

Supported by the National Human Genome Research Institute and the National Cancer Institute, TCGA focused on identifying similarities between cancers based on changes in their genes and in the way their genes are expressed. The initiative involved more than 150

researchers at more than two dozen institutions across North America, and it is coming to a close after generating comprehensive, multi-dimensional maps of the key genomic changes in 33 different types of cancer.

The UCRF has been a major source of support for key investments in laboratory tools, infrastructure, and faculty that enabled UNC Lineberger to take a leadership role in TCGA. This positioned UNC Lineberger researchers to be authors on 26 TCGA papers published in multiple leading journals in April 2018. Katherine Hoadley, PhD, assistant professor in the UNC School of Medicine Department of Genetics, led teams that published two of the final TCGA studies that have revealed important new findings.

One study supports an additional classification for human tumors based on the individual cell type from the organ in which they started. Using a molecular-based approach to help classify cancers could help improve clinical care and lead to the development of more effective treatment methods.

More than 10 years ago, researchers found that cancer is not a single disease, but many. They also learned that different cancer subtypes can occur within a single anatomic location, such as the breast or liver. Hoadley's new study found that some cancers are very similar molecularly to others that originated from the same starting cell type, even if they originated in a different organ. For example, squamous cell cancers from the head and neck, lung, and bladder, cervix, and esophagus had strong molecular similarities despite their various locations.

"Tumor location has been the primary method for determining treatment for a given cancer patient," Hoadley said. "This study helps us get a better understanding of the relationship across and within different tumor types. If tumors are genetically diverse within an organ, we should rethink the way we treat them."

Hoadley's other study discovered the genetic and genomic characteristics that define testicular germ cell cancers after analyzing 137 testicular germ cell tumors for potential mutations and other molecular changes. They identified molecular features of testicular germ cell cancers that could inform future efforts to improve treatment decisions.

Hoadley and her colleagues also identified markers that could potentially be used to monitor patients to see if their cancer had come back. They discovered that certain microRNAs were expressed differently in the different types of testicular germ cell tumors, and could potentially be explored as markers of low risk, or cancer recurrence.

Blood mutations could contaminate genetic analyses of tumors

Catherine C. Coombs, MD

UNC Lineberger researchers have shown that blood cell mutations accounted for as many as 8 percent of the mutations identified in large-scale genetic sequencing efforts at two major academic centers – potentially leading to errors in interpreting sequencing results.

Catherine C. Coombs, MD, and her colleagues used genetic sequencing results to identify mutations within solid tumor tissue as a way to help guide personalized care decisions for patients. Genetic mutations in blood cells that have made their way into tumors could mislead physicians looking for genetic tumor changes, which could result in misinformed treatment decisions.

For the study, researchers reviewed data from patients with solid tumor cancers who had genetic sequencing tests performed by Foundation Medicine as part of their routine clinical care at the N.C. Cancer Hospital and the Moffitt Cancer Center between 2013 and 2017. They also analyzed sequencing results for blood samples. A subset of patients at the N.C. Cancer Hospital had their tumors and their blood sequenced through UNCseq, a UCRF-supported genetic sequencing clinical trial run by UNC Lineberger researchers.

The study shows an advantage to “paired” sequencing tests, which evaluate mutations in both the blood and the tumor. “It adds expense, but it can be useful in determining whether a suspicious mutation is blood-derived, or tumor-derived,” said Coombs, an associate member of UNC Lineberger and an assistant professor of medicine in the division of hematology/oncology.

Researchers define structure, function of enzyme key to blood cancers

Greg Wang, PhD

UNC Lineberger researchers collaborated on a study to determine the structure and function of DNMT3A, an enzyme that is commonly mutated in blood disorders and cancers including acute myeloid leukemia.

Mutations in DNMT3A are thought to be one of the first mutations that set blood stem cells on a path to leukemia.

DNMT3A normally helps to maintain the patterns of “chemical tags” in the DNA to keep certain genes in check. UNC Lineberger’s Greg Wang, PhD, working with scientists from University of California, Riverside, identified how DNMT3A places a type of chemical tag at specific DNA sequences, and how mutations in the enzyme can lead to a change in the development course for the cell, as seen in cancer and developmental disorders.

“Now, because we understand the structure of this enzyme and its interaction with DNA, we see where exactly the cancer-related mutations often occur,” said Wang, an associate professor in the UNC School of Medicine Department of Biochemistry & Biophysics.

In 2016, this same group of UNC Lineberger researchers discovered that a specific mutation in the DNMT3A gene contributes to the progression of blood cancer by interfering with the way proteins within the enzyme interact with each other.

The new study builds on that understanding by showing that cancer cells also often gain somatic mutations to change DNMT3A's interaction with DNA. When a mutation affects the enzyme's ability to bind with DNA, it changes patterns of the chemical tags in DNA, which affects the cell's future development and can lead to cancer.

Genetic sequencing leads to new method of classifying cancers, treatment strategies based on immune response

In a project that makes unprecedented strides in the understanding of how the immune system responds to cancer, UNC Lineberger researchers and colleagues from The Cancer Genome Atlas (TCGA) analyzed thousands of cancer samples across multiple different tumor types to classify them based on the body's defense response – showing a path toward more effective immunotherapy treatments.

Two TCGA studies led by UNC Lineberger's Ben Vincent, MD, assistant professor in the Division of Hematology/Oncology, have made breakthroughs in key areas in immunotherapy research. One study has revealed how patients' immune systems respond to a particularly aggressive breast cancer, providing a basis for improved treatment. The other study discovered that tumor cells produce an immune "microenvironment" around them that offers a new method for categorizing and may offer new therapeutic options, including immunotherapies, for some patients.

About half of patients with triple negative breast cancer will also develop cancer in the brain once the breast cancer has begun to spread. Vincent and colleagues hope to improve outcomes for patients with breast cancer brain metastases by using the immune system as a basis for treatment.

They analyzed samples of triple negative breast cancer that had spread to the brain along with matched primary tumors and used genetic sequencing to determine what types of immune cells were present in the tumors. The researchers found that triple negative breast cancer brain metastases typically had lower numbers of immune cells in them, but that the immune cells present were of a type that typically has responded to specific treatments: immune checkpoint inhibitors. These are new drugs that "remove the brakes" on immune cells to allow them to attack tumors. The researchers believe that if they can increase the numbers of immune cells that are able to get to the brain metastases, they would see a better response to checkpoint inhibitor therapies.

"This research is still early, but we think that if we can find a way to get immune cells there, they will be responsive there – they will do their job," Vincent said.

Vincent and colleagues also revealed a new method for categorizing cancers based on their findings about the characteristics of the immune "microenvironment," the collection of non-cancerous cells found in a tumor sample that are part of the immune system. Using different types of genetic sequencing methods, including analyzing DNA, gene expression, and other genomic approaches, the researchers identified different types of immune cells and signals within tumors. They found that not all cancers shared the same immune system features and determined there were six different subtypes of immune microenvironments.

Mapping the molecular complexity of tumors based on their immune responses will help design treatment strategies that can improve the immune system's ability to recognize and attack tumors, the researchers said.

"This new classification is associated with cross-talk between the genetic makeup of the tumor and the immune response," said paper co-author Jonathan Serody, MD, UNC Lineberger's associate director for translational sciences, and the Elizabeth Thomas Professor of Medicine, Microbiology and Immunology in the UNC School of Medicine. "These findings shed a lot of light on the interaction of the tumor and immune system and provide a rational approach for immune-targeted therapy."

RESEARCH PRIORITY 2: DEVELOPING NOVEL THERAPEUTICS

UNC researchers focus on nanoparticles to improve disease tracking, drug delivery

Andrew Z. Wang, MD

From tracking the spread of disease to precisely delivering or boosting the effectiveness of drug therapies, nanoparticles are small in size but can have a big impact on the way cancer is diagnosed and treated. The research of UNC Lineberger member Andrew Z. Wang, MD, utilizes these tiny particles in several different ways in an effort to improve cancer care.

In lab studies using nanoparticles to bind molecules that can unleash and stimulate immune cells, Wang and his colleagues found they can more effectively trigger the body's defenses against cancer – offering a promising new nanotechnology-based delivery method for an immunotherapy combination.

"Our immune cells have both positive and negative signals, like red lights and green lights," said Wang, associate professor in the UNC School of Medicine Department of Radiation Oncology. "It's part of the balance of the immune system -- if you get too much immune activation, you get autoimmune disease. If you go the other way, immune suppression can allow tumors to gain a foothold and grow. We are studying a combination of treatments that both send green light signals to attack, and to block red light signals. Our study suggests that if you're able to present two different therapeutics at the same time to immune cells to help them fight cancer, the effect is greater."

Immune cells called T-cells can fight and kill tumors, but they have regulatory signals that limit their effectiveness. Treatments called checkpoint inhibitors have been developed to block the "red light" regulatory signals so the T-cells are more effective in fighting cancer. Clinical trials have launched to test combining these checkpoint inhibitors with treatments designed to send "green light" signals to boost the immune response. UNC Lineberger researchers developed a mechanism that combines these two compound types on a single nanoparticle with the goal of producing better results.

Wang's findings have led the UNC System recently to award him and his colleagues a prestigious four-year, \$2.09 million UNC Research Opportunities Initiative grant to support this work investigating pharmacoengineering approaches to enhance the immune response to neoantigens.

Wang is also using nanoparticles to "trap" cancer cells as they circulate around the body as a way to improve disease tracking. Free-floating cancer cells are cast off from tumors and circulate in the blood, but are often hard to find amid the billions of ordinary red blood cells and other cells found in the blood. Accurately counting these cast-off cells could provide an additional way to screen for disease or track the effectiveness of treatment.

Wang and his collaborators counted circulating cancer cells in the blood of 24 patients undergoing radiation treatment for head-and-neck, prostate, rectal or cervical cancer. By forcing the free-floating cancer cells to slow down and using

tree branching-like nanoparticles to develop stronger molecular traps, they captured an average of 200 circulating tumor cells from each milliliter of a patient's blood — giving them a more accurate picture of cancer in each patient. They found that the numbers of circulating tumor cells dropped while patients were undergoing radiation therapy, and the numbers subsequently rebounded in those patients that ended up requiring additional treatment — suggesting that this technology could supplement other techniques for tracking the progress of treatment.

"Oftentimes, post treatment, we end up scanning patients frequently," Wang said. "Maybe the future is, instead of doing expensive scans, we can do a blood test, and if the test result shows no change, we leave them alone. If it suggests there may be trouble, we may then do additional scans to locate the recurrent tumor."

By forming clots in tumors, immune cells aid lung cancer's spread

Chad Pecot, MD

UNC Lineberger's Chad Pecot, MD, a medical oncologist, and colleagues have found that immune cells that flock to a particular type of lung cancer and help form clots within tumors to promote healing are actually building a foundation for the tumor to spread within the body.

Squamous lung cancers, which account for about 30 percent of all lung cancers, make a signal called CCL2 to help recruit immune cells called inflammatory monocytes. These immune cells build fibrous clotting scaffolds in response to the wound — but these scaffolds also allow tumor cells to migrate and spread to other parts of the body. When looking at tumor samples from patients, the researchers found that

tumors with high amounts of clotting fibers were associated with an increased risk of the tumor spreading.

Researchers genetically manipulated the expression of CCL2 in a metastasis model developed in their laboratory and found that low expression was linked to reduced metastasis, while high expression was linked to enhanced metastatic features. They also found that the presence of a clot made it easier for cancer cells to move and migrate. And by using a compound that blocks CCR2, a receptor on the surface of the inflammatory monocytes, researchers saw a significant decrease in lung metastases.

"We want to make progress for patients with lung squamous carcinoma and expand the therapeutic options available to these patients," said Pecot, an assistant professor in the UNC School of Medicine Division of Hematology/Oncology and the study's corresponding author. "The more we understand the progression of the disease, including how metastases occur, the more we'll be able to understand how we can regress this disease, or just keep it in check. We believe there are ways we can teach these tumors how to heal."

Bladder cancer model could pave the way for better drug efficacy studies

William Kim, MD

Not all bladder cancers are the same, and it has been difficult to for scientists to understand the biology of different bladder tumors — and, as a result, to develop therapies that work effectively on various cancer types.

But now, UNC Lineberger's William Kim, MD, Benjamin Vincent, MD, and colleagues have developed a new mouse model that may help them uncover why only a fraction of patients respond to new treatments that rely on checkpoint inhibitors, a class of immunotherapy drugs that "remove the brakes" that keep the immune system from attacking cancer cells.

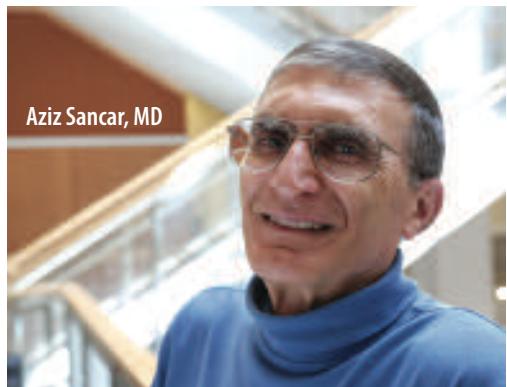

Five checkpoint inhibitors have been approved for metastatic, or locally advanced, bladder cancer since May 2016, giving patients additional options after standard therapy fails. But studies have shown that less than a quarter of patients will respond to these drugs.

The new mouse model of luminal bladder cancer, one of the two subtypes of advanced bladder cancer, was used along with an existing model for basal-like bladder cancer (the other subtype of bladder cancer) to examine features that may determine the effectiveness of checkpoint inhibitors. Researchers studied the immune microenvironment – the immune cells in and around the tumor – for each subtype. They found lower levels of immune cells in and around luminal tumors, and that the new luminal model did not respond as well to the immune checkpoint inhibitors.

These are the type of studies that can help doctors predict who will – or will not – respond to the new expensive drugs. Researchers also studied both subtypes' levels of neoantigens – proteins that sprout on the surface of cancer tumors as a result of DNA mutations or other changes in cancer cells. Scientists are interested in using neoantigens to predict response to immunotherapy treatments, or as drug targets.

The researchers used genetic sequencing to predict which abnormal proteins would appear on the surface of the cancer models, and then studied the extent to which the abnormal markers triggered the immune system. They found the luminal subtype had fewer markers that had the ability to trigger the immune system. Future research will investigate how neoantigens help elicit an immune response, and whether they can augment the activity of checkpoint inhibitors.

Timing treatments based on circadian clocks could optimize chemotherapy

Tiny protein-operated clocks inside our cells that run based on the 24-hour day cycle are important for the biological function of different organs. It is unclear, though, how these circadian clocks interact with other basic and crucial biology, such as DNA repair.

UNC Lineberger scientists led by Nobel laureate Aziz Sancar, MD, PhD, the Sarah Graham Kenan Distinguished Professor of Biochemistry and Biophysics, have developed a way to measure the repair of DNA damage caused by cisplatin – a common anti-cancer drug. Sancar's lab measured DNA repair after cisplatin treatment over a 24-hour circadian cycle throughout an entire genome of a mammal,

determining for the first time which genes were repaired, where exactly, and when, laying the groundwork for a more precise use of anti-cancer drugs.

Cisplatin kills cancer cells by binding to particular parts of the cancer cell's DNA, but its toxic side effects on the kidneys, liver, and nervous system limit the drug's usefulness. Knowing how and when normal cells in various organs undergo DNA repair would help doctors understand the best times to administer drugs. Sancar's lab hopes to use chronotherapy – adjusting the timing of treatments according to a patient's biological clock – to ramp up cancer cell death while reducing side effects by taking into account when DNA repair occurs, which is a crucial aspect of cancer and normal health.

To discover how the circadian clock and DNA repair interact, the researchers treated mice with cisplatin over a 24-hour period and used a method they developed over several years to measure the repair of DNA damage throughout the genome of a mouse. They pinpointed nearly 2,000 genes that were repaired according to the circadian clock. Sancar's lab found that the DNA repair affected different parts of these genes – some repair processes peaked at pre-dawn or pre-dusk, but other repairs peaked only at pre-dusk.

"Our work suggests it could be best to give cisplatin to patients when their normal cell DNA repair is at its zenith," said Sancar, one of three scientists who won the 2015 Nobel Prize in Chemistry for showing how DNA is repaired

after damage. “Right now, we are still learning the basic mechanisms of DNA repair in relation to the circadian clock. But we think understanding the precise ways our circadian clocks work is key to slowing the progression of cancer. And we think it’s possible to harness the power of chemotherapy while decreasing toxic side effects.”

Researchers identify brain cancer target, develop immunotherapy approach to attack it

Gianpietro Dotti, MD

An international team of researchers led by UNC Lineberger’s Gianpietro Dotti, MD, has genetically engineered immune cells to hunt and kill brain tumors – an approach that holds promise for a new immunotherapy treatment for glioblastoma, the most lethal primary brain tumor.

Conventional glioblastoma treatments, which typically include surgery, radiation and chemotherapy, typically produce a survival benefit of less than a year and a half. Only about one third of patients with brain and other nervous system cancers live five years.

UNC researchers, in collaboration with the Fondazione Istituto di Ricerca e Cura a Carattere Scientifico in Milan, Italy, have modified immune cells to hunt brain tumors displaying a new molecular target called CSPG4, which is highly prevalent on brain cancer cells. Their preclinical studies of immune cells engineered to recognize CSPG4 showed promise for controlling tumor growth in mouse and cell models for glioblastoma.

“Glioblastoma is a tumor of the brain that has a very low chance of being cured with current available therapies,” said Dotti, a professor in the UNC School of Medicine Department of Microbiology and Immunology and the senior author of the study. “This is a potential new way to treat these tumors using the immune system.”

The study is part of a research program launched at UNC Lineberger to develop personalized immune-based treatments called chimeric antigen receptor T-cell, or CAR-T, therapies. This approach involves removing a patient’s immune cells and genetically engineering them to recognize and attack cancer. Other centers have launched CAR-T clinical trials for glioblastoma, but the UNC Lineberger team designed immune cells that hunt CSPG4, a different antigen on the surface of glioblastoma cells that they believe could be more potent than other targets.

The researchers found that T-cells genetically engineered to target CSPG4 controlled the growth of tumor cells in multiple models of the disease. They also found an immunosuppressive response by brain cancer cells that could limit response of CAR-T cells to glioblastoma – a problem that researchers hope to tackle in future studies.

UNC Lineberger researchers have already launched clinical trials for CAR-T cell-based therapies in patients with blood cancers, but Dotti said they are planning to try to investigate this approach for glioblastoma and other solid tumors as well. As envisioned, the glioblastoma clinical trial would focus on patients with advanced recurring disease that requires additional surgery. To further ensure patient safety, researchers plan to incorporate a so-called “safety switch” into the therapy so that T-cells can be eliminated rapidly if toxic effects are observed.

Narrowing the gap toward personalized medicine for pancreatic cancer

Pancreatic cancer is one of the deadliest types of cancer – the five-year survival rate is 8 percent in the United States. UNC Lineberger member Jen Jen Yeh, MD, is researching ways to improve survival rates by using molecular-based approaches to individualize treatment.

One of the challenges in treating pancreatic cancer is that while stroma – a web of connective tissue that can surround pancreatic cancer tumors – can block treatment from reaching the tumor, it may also prevent the tumor from spreading.

Jen Jen Yeh, MD

Yeh co-led a study in which researchers analyzed levels of stroma surrounding pancreatic cancer tumors, and in distant metastatic sites. They found the primary tumors had a significantly higher stromal density than the cancer that had spread to solid organs. Patients with dense stroma in their primary tumors had longer survival than other patients.

Since stroma appears to be important to survival, Yeh said physicians need to think before taking away the stroma on patients for whom their stroma is protective, which makes early detection of stroma density especially important.

“The vast majority of pancreatic cancer patients die with metastases, so therapies are targeted to metastatic disease,” said Yeh, a professor in the UNC School of Medicine Division of Surgical Oncology and the vice chair for research in the Department of Surgery. “The finding that different sites of pancreatic cancer have different amounts of stroma may have therapeutic implications.”

Previously, Yeh found that patients can have two different biological or molecular types of tumors and stroma. In a recent study she co-authored building on her previous discovery, Yeh found that patients with one subtype of pancreatic tumors were more responsive to treatment than were patients with a different subtype.

“These studies emphasize the potential importance of individualizing therapies for specific tumor characteristics, and the need to develop ways to identify these characteristics with either biopsies or noninvasive imaging approaches,” Yeh said.

Timing could matter to how responsive cancer cells are to treatment, study suggests

Jeremy Purvis, PhD

DNA damage occurs routinely in cells due to sun exposure, smoking and sometimes during the normal process of making new DNA. Fortunately, cells have “checkpoints” that stop them from making more DNA and dividing before the damaged DNA is repaired. But in the case of cancer, cells may ignore these checkpoints, and go on to divide with damaged DNA, according to a study.

UNC Lineberger’s Jeremy Purvis, PhD, has found that the timing of when DNA damage occurs within these different checkpoints matters to a cell’s fate. The findings could be helpful in predicting the outcome of cancer treatment with radiation and chemotherapy, which can cause severe damage to cancer cells’ DNA, triggering them to stop division.

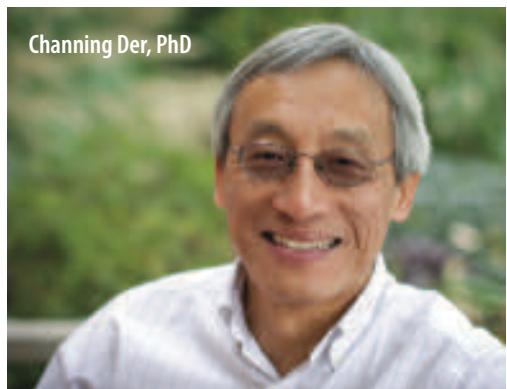

For the study, the researchers used time-lapse microscopy to study cells as they moved through three cell cycle phases, tracking the fate of individual cells after they received DNA damage. They found that the cells’ response to DNA damage during certain cell cycle phases was strong and completely halted the cell cycle. In other phases, however, cells were relatively less sensitive or showed delayed but steady progression.

They used the data to build a mathematical model of how timing affects checkpoint behavior. The model suggests that the precise timing of DNA damage not only determines checkpoint behaviors, but also alters the cellular outcomes for damaged cells.

Researchers say the findings could inform new treatment strategies for administering common cancer therapeutics. Their findings suggest the possibility of synchronizing cancer cells in more susceptible cell cycle phases before treatment.

“Conceptually, it makes sense that if you could get all of the cells in the same cycle at the same time, you could damage them all with one shot,” said Purvis, an assistant professor in the UNC School of Medicine Department of Genetics. “The key will be finding ways to separate cancerous and healthy cells based on the timing and synchronization of their cell cycles.”

Scientists lay the foundation for better research into anti-RAS therapies

Channing Der, PhD

UNC Lineberger’s Channing Der, PhD, and colleagues have reported new findings that could help researchers identify treatments for cancers with mutations in the RAS gene family, which are among the most highly mutated genes in cancer.

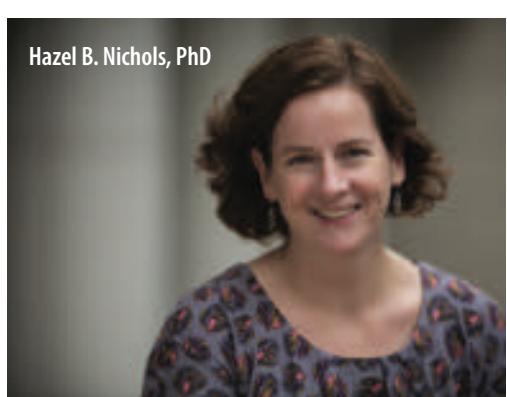

Despite more than three decades of research, treatments to target these cancer-driving RAS genes have remained elusive. In a recent study, Der and colleagues were able to screen chemical reagents to help researchers in the search for effective RAS-targeted therapies. They rigorously tested commercial antibodies to identify those that accurately recognized each of the four RAS proteins made by the three different RAS genes (KRAS, NRAS and HRAS).

“A successful anti-RAS drug has yet to reach the cancer patient,” said Der, the Sarah Graham Kenan Distinguished Professor in the UNC School of Medicine Department of Pharmacology. “One factor that has compromised these efforts has been the lack of well-evaluated reagents to study the three RAS genes. In our study, we completed a careful and thorough validation of antibodies to study RAS. Our study will provide a critical guideline to improve future RAS studies.”

Using unique scientific models, Der and colleagues were able to determine which of the commercial antibodies could properly identify the HRAS, NRAS, and KRAS proteins. If the antibody falsely identified a protein in their models, researchers knew it was not properly screening for RAS. By selecting the antibodies that work accurately against RAS, scientists can improve the quality of research. They plan to use their findings in their own research on pancreatic cancer. Der said his lab will study KRAS in pancreatic and lung cancer, NRAS in melanoma, and HRAS in head and neck cancers.

RESEARCH PRIORITY 3: OUTCOMES

Studies explore breast cancer risk factors, effects on survivors’ newborns

Hazel B. Nichols, PhD

UNC Lineberger member Hazel B. Nichols, PhD, is working to better understand risk factors for breast cancer in younger women as well as possible effects on the babies of breast cancer survivors.

Nichols, assistant professor in the UNC Gillings School of Global Public Health, co-led a study showing that a higher body mass index is associated with lower breast cancer risk for younger women, in contrast to the link between obesity and cancer risk for women after menopause. These findings show the need to better understand breast cancer risk factors in younger women before menopause.

Breast cancer is most common in older women, with a median U.S. age of diagnosis at 62, and obesity has been linked to higher risk for breast cancer in women after menopause. Since breast cancer is less common in younger women, researchers pooled data from 19 studies to investigate breast cancer risk for a group of 758,592 women who were younger than 55 years. Their analysis linked a higher body mass index (BMI) to lower breast cancer risk for younger women across this age group, even for women within a normal weight range.

“Although breast cancer is more common at older ages, it’s actually the most common type of cancer diagnosed among reproductive-aged women,” Nichols said. “Understanding risk factors that may operate differently before menopause is critical to reducing breast cancer risk in young women, but these factors are hard to study in traditional settings where there are fewer young women in cancer research.”

Nichols has also been part of a study on the effects of breast cancer on survivors’ children – finding that for young breast cancer survivors, the risk of giving birth prematurely, and other health concerns for their newborns, may depend on the type of breast cancer they had.

“This study is one piece of a larger effort to understand the needs of women with breast cancer beyond their cancer treatment,” Nichols said. “A breast cancer diagnosis can impact a lot of different aspects of your life, and building a family is one of them. Increasingly, research is focused on providing answers for those long-term questions that women have.”

The study used N.C. Central Cancer Registry data to analyze the cases of 4,978 women diagnosed with breast cancer in North Carolina between 2000 and 2013. For the group overall, they found no significant difference in the prevalence of preterm birth, low birth weight, and other measures between women with or without breast cancer. But for women with estrogen receptor-negative breast cancer, 18 percent of births were preterm. That compares to a rate of about 10 percent of all births in North Carolina that are preterm, Nichols said. She cautioned that they need to ensure this is a real finding by examining a larger number of patients.

Compared to the general population, the birth rate for women with breast cancer in the study was about 57 percent lower than for women who did not have breast cancer, Nichols said. Births were less common in women who received chemotherapy, and in women who had breast cancer at more advanced stages.

The researchers plan to survey young women with breast cancer to probe possible explanations for the lower birth rate among breast cancer survivors. They hope to determine if it is a side effect of treatment or whether the women chose not to become pregnant. They also intend in a future study to evaluate whether preterm birth affects later outcomes for the child’s health.

[Home HPV test may be lifesaving for women who don't have cervical cancer screenings](#)

About 12,820 women in the United States will be diagnosed with invasive cervical cancer this year, and close to one third of them will die. The disease is highly preventable: Half of the cases in this country are in women who are never or rarely screened. But a new study finds that a convenient at-home test for human papillomavirus (HPV) is a promising tool for preventing cervical cancer in underscreened women.

Led by UNC Lineberger member Jennifer S. Smith, PhD, professor of epidemiology at the UNC Gillings School of Global Public Health, the study recruited 429 women in North Carolina who were overdue for a Pap test, which analyzes cervical cells for the presence of cancer.

The participants received a kit by mail to self-collect a cervico-vaginal sample, return it by mail, and get their HPV results by telephone. Participants also received information about where to receive affordable Pap testing at a local clinic.

Of the 275 women who returned a sample, 15 percent tested positive for HPV. And of the women who had HPV, 82 percent followed through with a follow-up in-clinic appointment for Pap testing.

Lack of health insurance and poor access to medical services are major reasons that women do not receive screening. However, women also may be embarrassed or feel discomfort when undergoing a Pap test. The home self-test alleviates that barrier.

"Our study aimed to approximate a scalable model for increasing coverage among infrequently screened women by incorporating at-home HPV self-testing into a screening program," Smith said. "Mailing self-collection kits was feasible, with high return rates among women with infrequent screening histories. Our findings add to growing evidence that HPV self-testing can be a powerful tool to engage hard-to-reach women at higher risk of cervical cancer into preventative screening."

UNC focuses on young adult oncology patient research, co-hosts inaugural symposium

Andrew Smitherman, MD, MSc

Lauren Lux, LCSW

Improving care for adolescents and young adults with cancer and sparking collaborations to drive research in this field were the goals of the inaugural N.C. Adolescent and Young Adult Oncology Symposium, co-hosted by UNC Lineberger and the Mountain Area Health Education Center.

The symposium brought together multidisciplinary providers and researchers from around the state and included talks on many different aspects of care for this age group, including financial burden, fertility preservation, impact on caregivers and family, and issues of survivorship for patients who go on to live many years beyond their diagnosis.

Better educating health care providers on serving this population and encouraging collaboration in research efforts are both needed to improve care, said Andrew Smitherman, MD, MSc, the new medical director of UNC Lineberger's Adolescent and Young Adult (AYA) Program. Smitherman works collaboratively with Lauren Lux, LCSW, AYA program director, to provide personalized care and support for people ages 13-30 who are being treated for cancer at the N.C. Cancer Hospital and UNC Children's Hospital.

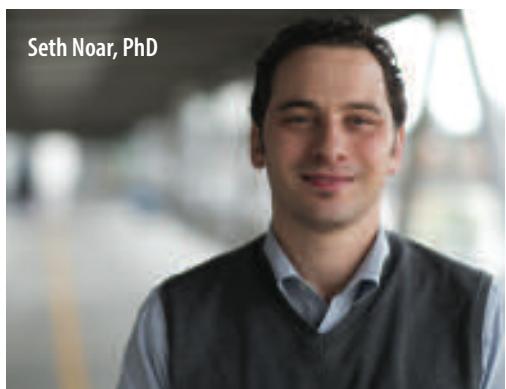

Smitherman said part of his charge is to grow the capacity of AYA-focused research at UNC Lineberger. Only in the past two decades have researchers started to systematically examine the needs specific to adolescents and young adults, and there are ongoing questions about side effects for young adult survivors of cancer, optimal treatment regimens, and mental and emotional support.

"Adolescents and young adults are in an extreme transition," Smitherman said. "They're establishing their independence, they're establishing their romantic relationships, they're establishing their self-identity and body image, and that all gets turned on its head when they get a cancer diagnosis. Their future is suddenly derailed. Because of this time of extreme developmental change and transition, it has the potential for a greater effect, and it means the needs are different, and require unique and tailored support."

UNC researchers report findings on e-cigarette toxicity, vendors; explore deterring teen use

Rebecca Williams,
MHS, PhD

Seth Noar, PhD

Several UNC Lineberger members have been studying e-cigarettes, which are a major public health issue especially among adolescents and teenagers. Besides nicotine being a highly addictive substance and harmful to adolescent brain development, researchers are still discovering the hidden impacts of e-cigarette use.

Recent surveys suggest that roughly 15 to 25 percent of American high school 11th and 12th graders have used e-cigarettes. Other surveys showed that 10 to 15 percent of American adults have used the products. These numbers rise every year, but so far there have been few studies on the health effects of vaping.

One study, which created a new screening technique to test the different toxicity levels of the more than 7,700 types of e-liquid flavors available to consumers, found that e-liquids are far from harmless and contain ingredients that can vary widely from one type of e-cigarette to another. The researchers set up a database of e-liquid ingredients and their toxicity data at www.eliquidinfo.org.

E-liquid's main ingredients of propylene glycol and vegetable glycerin have been considered non-toxic when delivered orally, but e-cigarette vapors are inhaled. The UNC scientists found that even in the absence of nicotine or flavorings, small doses of these two organic compounds

significantly reduced the growth of the test cells. E-liquids include small amounts of nicotine and flavoring compounds. The study found that these ingredients varied tremendously across the e-liquid products tested, and on the whole, more ingredients meant greater toxicity.

Other concerns about e-cigarettes – such as the increase in online vendors and marketing practices that make it easy for teens to buy these products – were the focus of studies led by Lineberger member Rebecca Williams, MHS, PhD. In these studies, researchers reported that the number of online e-cigarette vendors more than tripled between 2013 and 2014, and that low prices, a range of appealing flavors and ineffective age restrictions make these products easily accessible to youth.

"This study shows that e-cigarettes have been widely available online to minors and adults alike, at extremely cheap prices, with a wide variety of youth-appealing flavors, and making many unsubstantiated health claims to draw in customers," said Williams, a research associate for cancer prevention and control at the School of Medicine.

Based on a content analysis of the 283 most popular sites, they found that vendors made a wide range of social and health claims, including more than half citing health advantages to e-cigarettes compared to cigarettes. They also found online pricing starting as low as \$1 for disposable e-cigarettes. A prior study found that vendors' age verification methods do not effectively block youth access, and that many e-cigarette sellers use payment, shipping, and delivery methods that are banned for cigarettes.

Other Lineberger members are examining teen use of e-cigarettes and how best to communicate the health risks to young users.

One study suggests that a lot of youth who are not interested in regular cigarettes are susceptible to using e-cigarettes, despite the fact that very little is known about long-term health consequences of vaping. It's estimated that there are 55,000 high school students in North Carolina at low risk of smoking cigarettes but at high risk for sustained e-cigarette use.

In what is believed to be one of the first studies to analyze correlates of e-cigarette use among adolescents not susceptible to smoking cigarettes, the researchers found that adolescents who are not susceptible to smoking cigarettes and who thought e-cigarettes were less harmful were more likely to use e-cigarettes, and that youth exposed to e-cigarette vapor in public places were also more likely to use e-cigarettes. The study also found that 26 percent of those surveyed were at high risk for future e-cigarette use.

“Knowing that e-cigarettes contain addictive nicotine made no difference in whether teens used e-cigarettes or not, but believing that using e-cigarettes would get them addicted did make a difference. In fact, adolescents who believed that using e-cigarettes could get them addicted were much less likely to use them,” said UNC Lineberger’s Seth Noar, PhD, a professor in the UNC School of Media and Journalism.

Noar said the findings are important to future efforts to communicate with adolescents about e-cigarette health risks. He said researchers are starting to test different types of messages to better communicate about e-cigarette health risks to prevent and deter their use. “We are testing a platform that adolescents know and love – text messaging,” Noar said. “This is an important line of research given that e-cigarettes have become the tobacco product of choice among youth. We need to change that.”

Chen awarded \$11.9 million grant to study radiation treatments for prostate cancer

The Patient-Centered Outcomes Research Institute has awarded UNC Lineberger’s Ronald C. Chen, MD, MPH, a five-year, nearly \$12 million grant to fund a national comparative study of two radiation treatments for prostate cancer: intensity-modulated radiation therapy (IMRT) and proton beam radiation. Chen, an associate professor of radiation oncology at the UNC School of Medicine, will lead the largest prospective study to date comparing IMRT to proton radiation for prostate cancer in order to examine side effects, quality of life, cure rates and survival.

More than 161,000 men in the United States will be diagnosed with prostate cancer this year, and the disease will cause 28,000 deaths, according to American Cancer Society estimations. About one in three men being treated for prostate cancer receive radiation, with IMRT as the most common form of treatment. Studies have shown that IMRT, which uses x-rays, is effective for many patients. But because some patients may experience short- and long-term side effects from IMRT, there

is growing interest in using proton therapy – which is more expensive, and it is not yet known whether proton therapy has fewer side effects than IMRT.

“Radiation therapy is an effective treatment for prostate cancer, but we do not have perfect knowledge about what form of radiation therapy is most effective or the impact the various forms of radiation therapy may have on a patient’s quality of life,” said Chen, who will serve as a principal investigator for the national study along with Dr. Nancy Mendenhall, the medical director of the University of Florida Health Proton Therapy Institute in Jacksonville.

The study will involve a prospective comparison of IMRT and proton therapy, with a focus on patient quality of life, toxicity and the effectiveness of controlling disease. The researchers will enroll 1,500 patients treated with proton therapy and 1,500 patients treated with IMRT from 42 treatment centers in the United States. Chen said findings from the study will influence health policy. Many insurers currently do not cover proton therapy for prostate cancer due to its higher cost and the lack of scientific data measuring its effectiveness compared to IMRT.

DEVELOPING RESEARCH PARTNERSHIPS ACROSS THE UNIVERSITY OF NORTH CAROLINA SYSTEM

UNC Lineberger's leadership understands the value of developing research partnerships with investigators at other University of North Carolina System institutions. In 2017, the cancer center funded eight research projects at NC State and East Carolina, and are in addition to UNC Lineberger's decade-long collaboration with faculty at North Carolina Central University. These partnerships make it possible to bring together a wider array of insights and resources to bear on the causes of cancer, the development of novel therapies and approaches to prevent the disease.

SUPPORTING INFRASTRUCTURE AND SHARED RESOURCES

In addition to recruiting and retaining world-class researchers and clinicians, investments from the UCRF have supported vital core infrastructure and shared resources. Imaging, informatics and other research tools are critical in improving cancer research and care. The development of virtual tumor boards, telemedicine, community and provider partnerships, and other outreach initiatives have helped us reach patients and clinical practices in every North Carolina county.

UNC Cancer Network educates medical professionals, patients

An important part of UNC Lineberger's function as a teaching hospital is to provide continuing education to health care providers across the state. A continuing medical education (CME) credit is a continuing education credit owned by the American Medical Association. Physicians earn CME credit by attending events sponsored by an accredited provider and can use the credit toward re-licensure, re-certification, and renewal of hospital privileges.

The UNC Cancer Network is a primary source of continuing education for oncology professionals. The program's bi-monthly continuing education series reaches physicians, nurses and allied health professionals across North Carolina through live, interactive medical and nursing lectures delivered by UNC faculty. This lecture series allows practitioners to access timely, evidence-based oncology therapeutic updates from the convenience of their own practice – and earn continuing education credits. Medical professionals earned 1,159 CME credit hours this year.

UCRF resources also have significantly improved UNC Lineberger's ability to connect with oncologists and cancer patients across North Carolina. Using the infrastructure supported by UCRF funds, UNC faculty regularly hold virtual "tumor boards" – in-depth review of a particular patient's case with a team of doctors – with doctors in hospitals across the state, and do consultations in specialties that are lacking in rural communities. This year 297 virtual tumor boards helped connect community-based medical professionals with UNC oncology experts.

UNC Lineberger's tumor boards also are an important source for continuing education. This year, tumor boards provided nearly 2,800 credit hours in the following specialty areas:

Breast	983
Gastro-Intestinal	655
Head and Neck	545
Hematology-Oncology (Parker)	278
Pediatrics	335
Total	2,796

Through the telehealth network, UNC Lineberger connects with health care providers in real time to discuss best practices for patient care and cutting-edge research, and holds community education events to raise patient awareness of issues related to cancer. This year, UNC Lineberger hosted 24 telehealth lectures with almost 2,330 participants including nurses, doctors, physician assistants, nurse practitioners, pharmacists, social workers, nutritionists and clinic managers in more than 20 oncology practices across the state.

The UNC Cancer Network North Carolina Community College Lecture Series also offered four courses designed for students enrolled in nursing and allied health sciences programs at 14 community college sites. The series had 101 student participants. These lectures provide opportunities for students to become more familiar with strategies necessary for caring for cancer patients.

Innovative cancer data resource expands

Academics and policymakers are using comprehensive UCRF-supported data resources to knit together information from multiple public and private sources in order to examine a wide range of complex issues tied to improving cancer outcomes in North Carolina.

When UNC Lineberger leaders approved the use of the UCRF to launch the Integrated Cancer Information and Surveillance System (ICISS) in 2010, the vision was to develop a tool that facilitated "big data" population-based cancer research. Now known as the Cancer Information & Population Health Resource (CIPHR), this data resource has continued to grow. CIPHR now has access to information on more than 500,000 cancer patients in the state, 80 percent of whom are linked to insurance claims data.

"Population health research is extremely data intensive, and aggregating and analyzing data from different organizations and platforms can be a significant barrier for scientists," said UNC Lineberger's Chris Baggett, PhD, the program's faculty director. "The investments UNC Lineberger and the university made were instrumental in expanding our capabilities to ask and investigate some challenging questions. It provided the foundation on which to build a nationally unique research tool."

Academics and policymakers are now using the data resource to knit together data from multiple public and private sources, including the North Carolina Cancer Registry and public and private health insurance claims, to examine a wide range of complex issues tied to improving cancer outcomes in North Carolina, such as what treatments are most effective or what geographic or economic factors affect prognosis.

"The next big test for CIPHR will be to effectively and securely link our core data to electronic health records and genetic data," Baggett said. "Connecting these data sets will allow researchers to take an unprecedented look at an even wider variety of factors that might influence cancer incidence or impact the delivery, cost and quality of cancer care."

Pope Foundation establishes "Tomorrow's Best Hope" Endowed Fellowship Fund

When UNC announced a \$10 million commitment from the John William Pope Foundation to support a combination of core areas where Carolina excels, UNC Lineberger and its commitment to training the next generation of cancer researchers was a key area of focus.

UNC Lineberger received \$5 million to establish the John William Pope "Tomorrow's Best Hope" Endowed Fellowship Fund. The fund will generate nearly \$250,000 each year for competitively awarded fellowships to recruit, educate and train future oncologists and cancer researchers to reduce cancer's burden in the state and beyond.

This latest gift builds on the Pope Foundation's support of the cancer center, which includes funds to create an award that recognizes emerging physician-researchers in-training and their efforts to improve cancer care through research, as well as the creation of the John William Pope Distinguished Professorship in Cancer Research, which honors the foundation's founder. The first recipient of the professorship is Thomas C. Shea, MD, who leads the UNC Bone Marrow Transplant Program and the UNC Cancer Network, which touches oncology professionals across the state. (See section above for more information about the UNC Cancer Network.)

Restrictions on the Use of UCRF Monies

G.S. 11629.1 established the UCRF as a special revenue fund and created the Cancer Research Fund Committee to provide accountability and oversight. As the Cancer Research Fund Committee, led by its Chairman, then-UNC President Erskine Bowles, developed the UCRF Strategic Plan in 2009, each potential use of UCRF resources was evaluated according to the following questions:

- Will it address North Carolina's needs in terms of the goal of reducing the cancer burden in the state?
- Can we be world class at it? (Does it build on existing strengths, and is there an opportunity to lead?)
- Is there a strong economic model/justification for UCRF investment?

Based on these questions, the Committee developed a clear set of rules to guide how UCRF funds would be best spent. The Committee determined that UCRF funds should focus major resources on a limited set of opportunities to have the greatest impact; fund initiatives where UNC has the opportunity to establish a leadership position; be self-sustaining and provide leverage for additional extramural funding; build fundamental cancer-related research capabilities that benefit UNC research programs; and enhance North Carolina's economy by creating jobs, intellectual property, and startup companies.

To maximize the effectiveness of the state's investment and to ensure wise and responsible use of the funding, the Strategic Plan imposed additional restrictions on the use of these funds, instructing that UCRF funds *should not*:

- Invest broadly in an effort to make incremental improvements everywhere;
- Provide funding that would limit future flexibility;
- Undermine faculty innovation and competitiveness by eliminating the need for extramural grant funding;
- Substitute for existing university or health system funding or new philanthropy;
- Make expenditures based upon institutional or other needs outside cancer research; or
- Negatively impact other research on campus, for example by appropriating shared research infrastructure or resources.

Expenditures of State Funds Related to UCRF

The table below provides an accounting of expenditures of state funding related to the UCRF. Further details regarding these expenditures are included as appendices to this report.

Categories	YTD Actual
Strategic Plan Categories	
Tier 1: Research Priorities	
Optimizing NC Cancer Outcomes	\$6,260,268
Understanding Genetics in Cancer – Basic approaches & Clinical Applications	\$7,463,776
Developing New Cancer Treatments	\$7,631,229
Tier 2: Opportunity Fund	\$10,484,212
Tier 3: Critical Infrastructure	
Clinical Excellence – Research & Outreach	\$6,277,665
Research & Tech Development and Training	\$9,504,957
Total	\$47,622,107

CONCLUSION

The University Cancer Research Fund is invested responsibly and effectively to support innovative research that will enhance the prevention, diagnosis and treatment of cancer and improve outcomes for patients. It has enabled us to form important partnerships and share research resources with other universities, the private sector, and with communities all across our state. The UCRF leverages remarkable amounts of external funding, and has sparked jobs and commercialization opportunities for North Carolina. Its total economic impact demonstrates a 9-to-1 return on investment.

The UCRF's economic benefits to our state continue to grow, and our advancements in cancer care and research will have a lasting impact both in and beyond North Carolina. We are sincerely grateful for the General Assembly's continued support of the University Cancer Research Fund – it is a vital tool in our ongoing efforts to defeat our state's deadliest disease.

APPENDIX

CANCER RESEARCH FUND COMMITTEE

CANCER RESEARCH FUND COMMITTEE

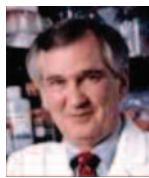

The legislatively established Cancer Research Fund Committee, chaired by Carol Folt, Chancellor of the University of North Carolina at Chapel Hill, oversees the University Cancer Research Fund. The seven-member committee includes five ex-officio members designated by the legislation who elect two at-large members. The at-large members are to be leaders at nationally prominent cancer programs. Currently, the two are Drs. Edward Benz (President and CEO Emeritus, Dana-Farber Cancer Institute) and Gary Gilliland (President and Director, Fred Hutchinson Cancer Research Center).

Executive Summary

In 2007, the state leaders of North Carolina developed a fund to invest in cancer research in the state through the University of North Carolina Lineberger Comprehensive Cancer Center. Cancer is one of the leading causes of death in North Carolina, and the fund was developed to demonstrate a commitment to the health of the state's residents. Although cancer mortality rates have been decreasing, incident rates of cancer have increased over the past decade.¹ Additionally, lung cancer continues to be the leading cancer-causing death in North Carolina.² The state is investing in this fund, ensuring that future generations of North Carolinians will develop cancer less often and live longer and better when they do.

The initial investment in 2007 to the University Cancer Research Fund (UCRF) of \$25 million has grown to nearly \$47.8 million for FY 2018. This year alone the FY 2018 \$47.8 million investment produced an economic impact of more than \$432.2 million, Tripp Umbach analysis shows. This investment has translated into innovative research to detect, treat, and prevent cancer and has given an opportunity for UNC to become home to one of the nation's leading public comprehensive cancer centers. University of North Carolina Lineberger Comprehensive Cancer Center (UNC LCCC) is one of only 49 National Cancer Institute-designated comprehensive cancer centers. The center brings together some of the most exceptional physicians and scientists in the country to investigate and improve the prevention, early detection, and treatment of cancer. With research that spans the spectrum from the laboratory to the bedside to the community, the faculty work to understand the causes of cancer at the genetic and environmental levels, to conduct groundbreaking laboratory research, and to translate findings into pioneering and innovative clinical trials. Investment in the UCRF allows the state an even greater ability to continue its tradition of care for all North Carolinians. It is an investment in making the best care in the world available in North Carolina, and it is difficult to think of a better investment than one for the future health of the state's residents.

People and place are the keys to the UCRF's success. UCRF is about investing in people – promising researchers with the best ideas for cancer research and master clinicians who know how to bring those findings to patients and others. UNC Chapel Hill and UNC Lineberger have a culture of collaboration – both across the university and with partners beyond the university's walls – that is essential to promote discovery and then turn those discoveries into new ways to treat, find, and prevent cancer. Outside of the obvious impacts that UNC Lineberger provides to North Carolina,

¹ Cancer in North Carolina 2013 Report. North Carolina State Center for Health Statistics.

² Cancer Profiles North Carolina April 2017 <http://www.schs.state.nc.us/schs/CCR/cp2017/NorthCarolina.pdf>

the UCRF offers additional impacts through the dollars that directly and indirectly impact the state economy and job numbers.

The aim of this report is to illustrate in detail the positive economic impact that UCRF dollars have on North Carolina's biomedical sector in the current year as well as the history of impacts the fund has shown over the last decade; it is important to note that these impacts have been annual since the fund's inception. Through expanding the state economy, creating jobs, generating tax revenue, encouraging scientific collaboration, and leveraging federal research funds, these dollars have provided a significant benefit to the state of North Carolina.

Key Findings

Expanding the state's economy. UCRF generated nearly more than \$432.2 million in total economic impact in North Carolina in 2018. This includes direct spending of more than \$231.1 million within the state, much of which is a result of the generation of funds from national grants due to research activities that are just a portion of the \$183.3 million in research funding received in 2018 alone. The ripple effect of in-state spending accounts for nearly \$201.1 million in additional funds, representing downstream spending by employees, vendors, and contractors. This is just the impact of the current year (2018). Tripp Umbach estimates that through the commercialization of the discoveries made from this research, the impact by 2028 will be dramatically larger.

Creating jobs. UCRF directly supported employment in 2018 of more than 1,105 jobs in North Carolina and an additional 1,515 jobs through both the indirect and induced impacts of those direct jobs and the spending generated from the UCRF within North Carolina. This means the total impact of this fund is more than 2,620 jobs.

Generating tax revenue. Tripp Umbach estimates that UCRF provided nearly \$14.8 million in local and state tax revenue in 2018.

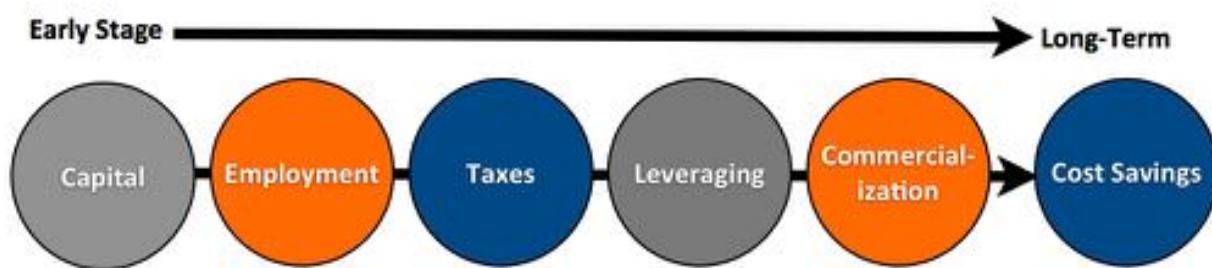

Encouraging scientific collaboration and leveraging federal research funds. These funds have encouraged recipient institutions to collaborate as well as to apply for and win highly competitive federal grants. Recipients of these state research funds have leveraged federal research funds amounting to more than \$156.9 million in federal research grants, bringing the total to more than \$183.3 million in external funding in 2018 alone. This would not have been possible without the UCRF funding, which elevated UNC Lineberger to the top rankings.

Impacts of UCRF in 2018

Any discussion of the economic impact of these state funds must be predicated on an understanding that research investments, by their nature, have a multitude of impacts on a state's economy, both in the present and in the future. Short-term impacts include capital and non-capital investment and employment growth supported by the funds and new federal medical research funding leveraged by North Carolina's funds that expand the state's economy. Longer-term impacts include a strengthened ability to compete nationally for funding and to attract world-class scientists; the economic and employment advances that will be achieved when medical research and innovation are translated into commercial products and services; and healthcare cost savings to the state as a result of innovation (see Figure 1):

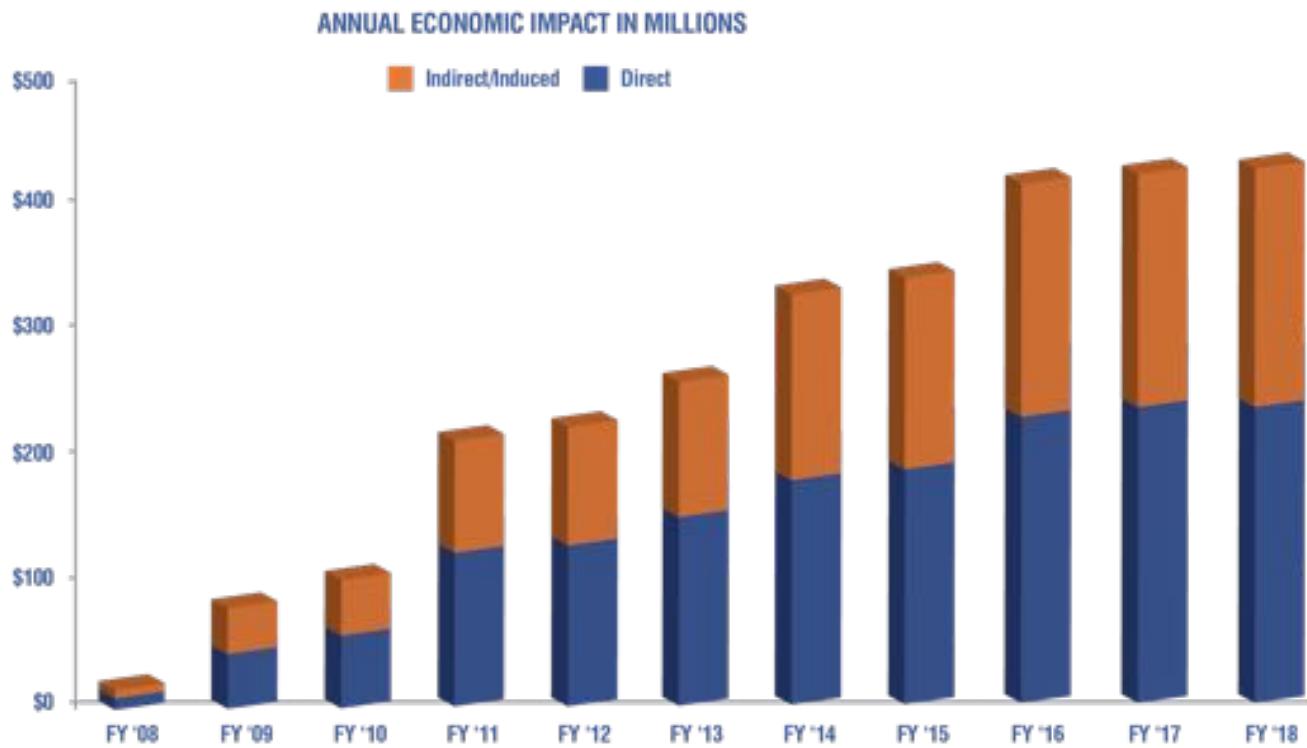

Figure 1: Research Return on Investment Timeline

Early Stage Economic Impact of Funding

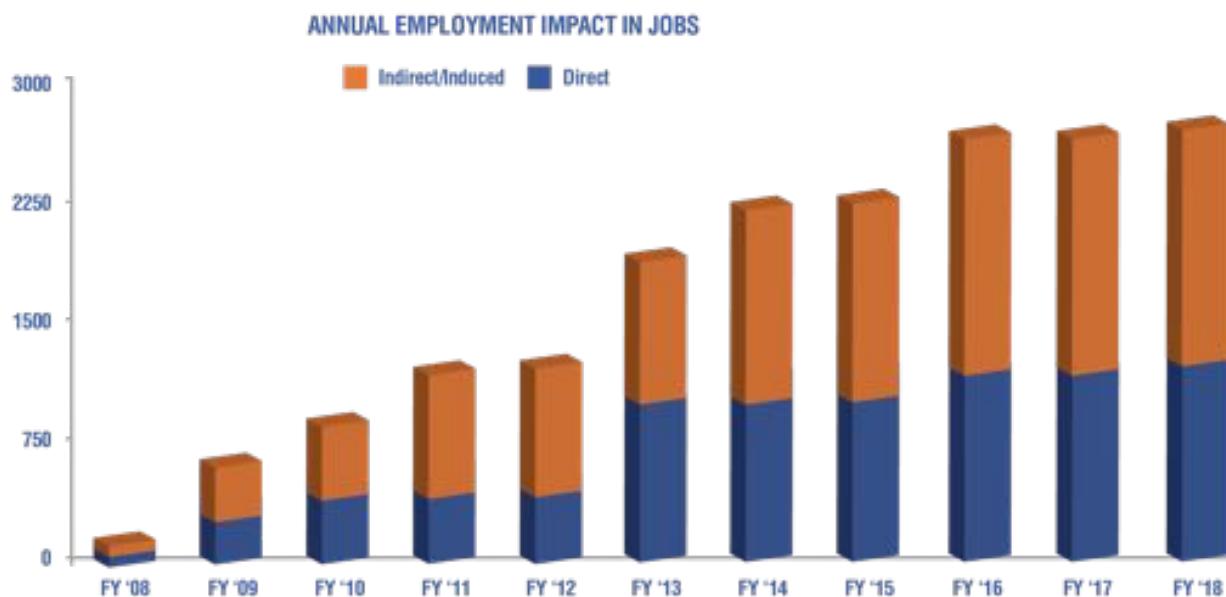

UCRF dollars invested in research in 2018 have resulted in an expansion of the state's economy by nearly \$432.2 million. Tripp Umbach's economic impact analysis indicates that even in the early stage (2007-2011), program investments in capital and human resources have returned greater than three dollars to the state's economy for every one dollar invested. In 2018, this amount has risen to more than nine dollars for every dollar invested. Spending attributable to the fund can be divided into two parts: direct and indirect/induced impacts.

The direct impacts of program funding include institutional expenditures for capital improvements and goods and services but also spending by researchers, research staff, subcontractors, and visitors who come to these institutions for conferences and meetings. The indirect impacts of tobacco funds result from these direct, first-round expenditures, which are received as income by businesses and individuals in the state and recirculate through the economy in successive rounds of re-spending. The end result is a multiplied economic impact that is a linear result of the state's investment in research. The impacts over the last decade are outlined below in the chart below.

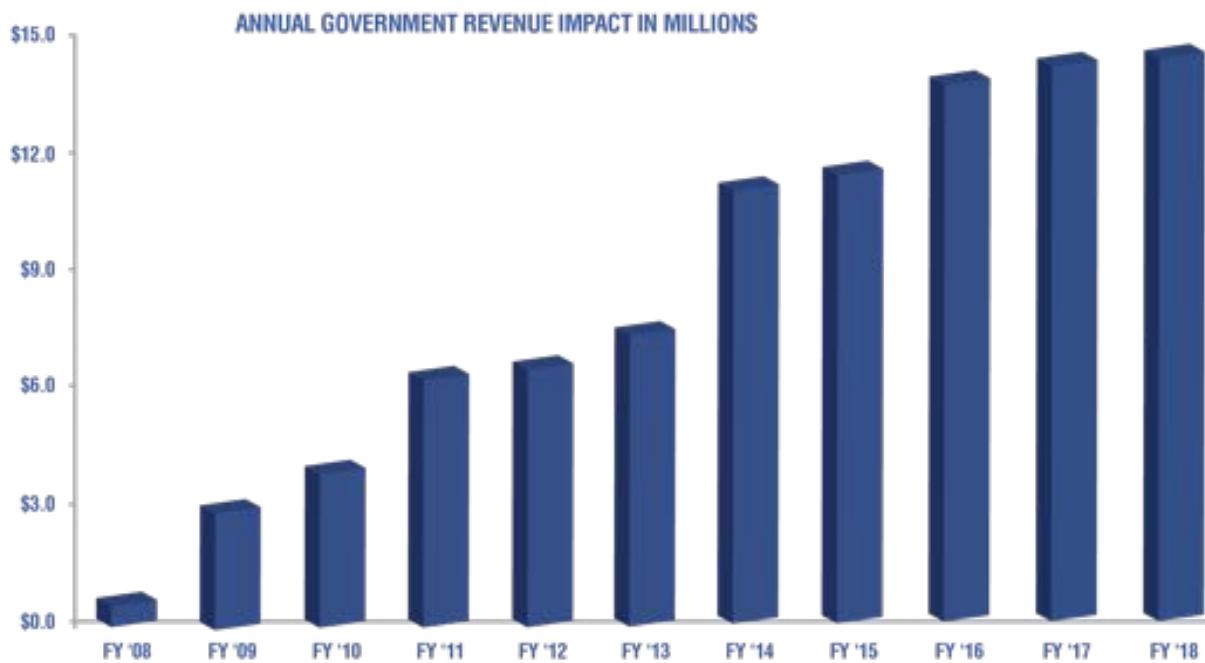

Early Stage Impact of UCRF Dollars on Employment

Tripp Umbach estimates that in 2018, UCRF dollars for healthcare research have created and sustained 2,620 high-paying research-related jobs throughout the state of North Carolina. This includes both the 1,105 high-paying research-related jobs directly attributed to UNC in addition to the 1,515 indirect and induced jobs supported throughout the state of North Carolina. The economic expansion created by the funds allocated to the UCRF have, in turn, brought about demand for additional employment in the state's economy. The employment impact has continued to grow and provide high-paying jobs to the state of North Carolina.

Early- and Later-Stage State Tax Impacts

Tripp Umbach estimates that funds provided in 2018 have resulted in nearly \$14.8 million in tax revenues to the state of North Carolina. In-state spending by the recipient organizations and spending in the state by out-of-state parties have a significant impact on state tax revenue. Taxes created as a result of spending in the state's economy, and generation of fresh dollars from outside of the state, are expected to grow as early-stage research is commercialized. The tax impacts have increased over the last decade as well provided a return to the state for the investment.

Impacts Associated with Leveraged Federal Medical Research Funds

The North Carolina academic medical industry and growing life sciences industry have been measurably enhanced by these state funds. This federal medical research funding helps fuel clinical enterprises. According to the Association of American Medical Colleges, North Carolina's academic medical industry ranks 11th for total annual economic impact³.

These funds from the state's UCRF have encouraged researchers at the recipient organization to collaborate to apply for and win highly competitive federal grants. These funds have enabled recipients of UCRF dollars to leverage federal research funds amounting to more than \$156.9 million, bringing the total to more than \$183.3 million in external funding in 2018 alone.

³ In 2018, North Carolina ranked 11th in Academic Medical Impact of AAMC members and COTH hospitals.

Healthcare Cost Savings

While this study does not include detailed economic impact models that calculate the potential cost savings attributable to research activities, a growing body of literature provides potential insights. Breakthrough research by Silverstein et al (1995) documented \$69 billion in annual economic savings resulted from NIH-supported research. The return on investment calculated by Silverstein was \$7 in healthcare cost-savings for every dollar invested in NIH-sponsored research.⁴

Commercialization

Additional impacts that will be realized because of the UCRF are the levels of commercialization that occur when clusters of research professionals collaborate on a specialty area of research. Tripp Umbach estimates that after 10 years of funding and operations, the commercialization of the UCRF will produce discoveries and spinoff businesses generating additional economic activity in the state of North Carolina. Looking at projected commercialization impact in 2028, Tripp Umbach estimates this to be from \$563.6 million at a conservative level of growth scenario to \$1 billion using the aggressive level of growth in additional economic activity within North Carolina. These activities will also create an additional 3,131 (conservative) to 5,630 jobs (aggressive) high-paying jobs. These additional economic and employment impacts will translate into additional state and local government revenue of \$16.9 million to \$30.4 million.

It is important to note that these commercialization impacts are in addition to the annual operational impacts of the UCRF and that these impacts will continue to grow as the research fund continues to be successful. These impacts are realized after years of research once the breakthroughs or discoveries have been made and the discoveries begin to hit the marketplace. Examples of successful spinoff businesses supported by UNC Lineberger include Meryx, G1 Therapeutics, Genecentric, EpiCypher, Epizyme, Liquidia, and many others. Since 2009, UNC Lineberger startup companies have raised more than \$300 million in non-dilutive financing from the NIH, angel investors, and venture capitalists.

Tripp Umbach's projections are based on 2018 funding and the national experience of peer academic medical centers that have implemented similar academic, clinical, research, and economic development plans during the past 20 years. Since 1995, Tripp Umbach has measured the economic impact of every U.S. academic medical center on behalf of the Association of

⁴ Cost-Savings Resulting from NIH Research Support, NIH Publication No. 93. Silverstein, H.H. Garrison and S.J. Heinig, 1995.

American Medical Colleges and used historical trending data from this experience in making projections.

Appendix A: Definition of Terms

Study Year

Fiscal Year 2018

Total Impact

The total impact of an organization is a compilation of the direct impact, the indirect impact, and the induced impact generated in the economy as a result of the organization.

Direct Impact

Direct impact includes all direct effects the organization has on the regional area due to the organizational operations. These items include direct employees, organizational spending, employee spending, as well as spending by patients and visitors to the organization.

Indirect Impact

The indirect impact includes the impact of local industries buying goods and services from other local industries. The cycle of spending works its way backward through the supply chain until all money leaks from the local economy, either through imports or by payments to value added. The impacts are calculated by applying direct effects to the Type I Multipliers.

Induced Impact

The response by an economy to an initial change (direct effect) that occurs through re-spending of income received by a component of value added. IMPLAN's default multiplier recognizes that labor income (employee compensation and proprietor income components of value added) is not leakage to the regional economy. This money is recirculated through the household spending patterns, causing further local economic activity.

Multiplier Effect

The multiplier effect is the additional economic impact created as a result of the organization's direct economic impact. Local companies that provide goods and services to an organization increase their purchasing by creating a multiplier.

Appendix B: Methodology

To fully quantify the impact of the funding of UCRF to the operations of UNC Lineberger Comprehensive Cancer Center within the various geographical areas throughout this study, Tripp Umbach established a study methodology. It was critically important that the methodology used would deliver a comprehensive, yet conservative, estimate of the operations' impact, based on information compiled using uniform and consistent techniques. In addition, the study team sought to develop a reproducible methodology, ensuring that subsequent studies could build upon the information and knowledge gained through this effort.

Tripp Umbach determined that the use of the IMPLAN Pro economic impact model software was most appropriate for this analysis. The IMPLAN econometric model operates by estimating the direct impact, indirect impacts, and induced impacts of specific economic activity. Direct economic impacts are those attributable to the initial economic activity. For example, an operation with 10 full-time employees creates 10 direct jobs. Indirect economic impacts are those economic activities undertaken by vendors and suppliers within the supply chain of the direct activity because of the initial economic activity. For example, suppliers of goods, materials, and services used in the direct activities produce indirect economic impacts. Induced economic impacts result from the spending of wages paid to employees in local industries involved in direct and indirect activities. Tripp Umbach selected the IMPLAN model because of its frequent use in economic impact, in addition to its development independent of local influences.

Tripp Umbach collected employment information concerning the economic activity of UCRF's funding on operations themselves and followed up in person to make certain the data was the most current available.

In this report, the impact was measured using IMPLAN datasets. The IMPLAN data files include information for 528 different industries (generally three- or four-digit SIC code breakdown) and 21 different economic variables. IMPLAN sources their employment data from ES202 employment security data supplemented by county business patterns and REIS data. Employment data used in the analysis includes full-time and part-time positions.

It should be noted that, at the time of performing the UCRF assessment, the most recent IMPLAN data files for the state of North Carolina were for 2015. While the data is not current, it is unlikely that the fundamental economic structure of North Carolina's economic fabric has changed to an extent that would invalidate the analysis. IMPLAN data and accounts closely follow the accounting

conventions used in the “Input/Output Study of the U.S. Economy” by the U.S. Bureau of Economic Analysis and the rectangular format recommended by the United Nations.

By deriving the direct and actual employment numbers from IMPLAN for each county, Tripp Umbach was able to conduct input/output modeling to analyze the current impact of the industry in each county. Tripp Umbach supplied additional information as required to supplement the data supplied by UNC Lineberger Comprehensive Cancer Center.

Appendix C: Tripp Umbach Qualifications

Tripp Umbach is the national leader in providing economic impact analysis to leading healthcare organizations and academic health centers. The firm has completed more than 250 economic impact studies over the years for clients such as the Mayo Clinic Rochester, The Cleveland Clinic, University of Florida Shands HealthCare, and the Ohio State University Medical Center. In addition to work on multiple occasions for the six allopathic medical schools and academic medical centers in Pennsylvania, Tripp Umbach has completed statewide studies for multiple institutions in Ohio, Virginia, South Carolina, Wisconsin, and Minnesota.

Tripp Umbach recently completed its fifth national study of all U.S. medical schools and teaching hospital affiliates for the Association of American Medical Colleges.

In addition to completing similar studies for UNC LCCC over the last 10 years, Tripp Umbach has also completed economic impact studies for cancer centers such as the CURE Funding for PA Cancer Alliance, The Wistar Institute, University of North Carolina's Cancer Hospital, Ohio State University's James Cancer Center and Solove Research Center, Ohio State University's Comprehensive Cancer Center, Milton S. Hershey Medical Center's Cancer Institute, Mayo Clinic/Allegheny General Hospital Cancer Services planning, UPMC Hillman Cancer Center feasibility and economic impact projections study, University of Pennsylvania projected economic impact of the Cancer Center as a component of the Civic Center project, and University of Florida Shands HealthCare economic impact projections.

APPENDIX

ESTABLISHING LEGISLATION

ESTABLISHING LEGISLATION

§ 116-29.1. University Cancer Research Fund (as modified by SL 2013-360)

- (a) Fund. – The University Cancer Research Fund is established as a special revenue fund in the Office of the President of The University of North Carolina. Allocations from the fund shall be made in the discretion of the Cancer Research Fund Committee and shall be used only for the purpose of cancer research under UNC Hospitals, the Lineberger Comprehensive Cancer Center, or both.
- (b) Effective July 1 of each calendar year, the funds remitted to the University Cancer Research Fund by the Secretary of Revenue from the tax on tobacco products other than cigarettes pursuant to G.S. 105-113.40A is appropriated for this purpose are appropriated for this purpose.
- (c) Cancer Research Fund Committee. – The Cancer Research Fund Committee shall consist of five ex officio members and two appointed members. The five ex officio members shall consist of the following: (i) one member shall be the Chancellor of the University of North Carolina at Chapel Hill, (ii) one member shall be the Director of the Lineberger Comprehensive Cancer Center, (iii) one member shall be the Dean of the School of Medicine at The University of North Carolina, (iv) one member shall be the Dean of the School of Pharmacy at The University of North Carolina, and (v) one member shall be the Dean of the School of Public Health at The University of North Carolina. The remaining two members shall be appointed by a majority vote of the standing members of the Committee and shall be selected from persons holding a leadership position in a nationally prominent cancer program.
If any of the specified positions cease to exist, then the successor position shall be deemed to be substituted in the place of the former one, and the person holding the successor position shall become an ex officio member of the Committee.
- (d) Chair. – The chair shall be the Chancellor of the University of North Carolina at Chapel Hill.
- (e) Quorum. – A majority of the members shall constitute a quorum for the transaction of business.
- (f) Meetings. – The Committee shall meet at least once in each quarter and may hold special meetings at any time and place at the call of the chair or upon the written request of at least a majority of its members. (2007-323, s. 6.23(b); 2009-451, s. 27A.5(e); 2010-31, s. 9.12.)
- (g) Report. – By November 1 of each year, the Cancer Research Fund Committee shall provide to the Joint Legislative Education Oversight Committee and to the Office of State Budget and Management an annual financial report which shall include the following components:
 - (1) Accounting of expenditures of State funds related to strategic initiatives, development of infrastructure, and ongoing administrative functions.
 - (2) Accounting of expenditures of extramural funds related to strategic initiatives, development of infrastructure, and ongoing administrative functions.
 - (3) Measures of impact to the State's economy in the creation of jobs, intellectual property, and start-up companies.
 - (4) Other performance measures directly related to the investment of State funds.
 - (5) Accounting of any fund balances retained by the Fund, along with information about any restrictions on the use of these funds.

APPENDIX

FY 2018 EXPENDITURES

FISCAL YEAR 2018 EXPENDITURES

Strategy	Annual Budget	Year to Date Actual*	Cash Balance
Tier 1: Research Priorities			
Optimizing NC Cancer Outcomes	\$6,375,000	\$6,260,268	\$114,732
Understanding Genetics in Cancer - Basic approaches & Clinical Applications	\$7,650,000	\$7,463,776	\$186,224
Developing New Cancer Treatments	\$7,489,093	\$7,631,229	-\$142,136
Tier 2: Opportunity Fund	\$10,450,000	\$10,484,212	-\$34,212
Tier 3: Critical Infrastructure			
Clinical Excellence and Outreach	\$6,775,000	\$6,277,665	\$497,335
Infrastructure	\$9,050,000	\$9,504,957	-\$454,957

APPENDIX

LIST OF ACTIVE EXTRAMURAL AWARDS

UCRF	Last Name	First Name	Sponsor	Number	Begin	End	Title	Total Cost \$
Recruitment	Akulian	Jason	Premier Research Group		5/19/15	5/18/19	A Phase III Study Evaluating the Efficacy and Safety of Remimazolam (CNS 7056) Compared to Placebo and Midazolam in Patients Undergoing Bronchoscopy	\$88,507
Recruitment	Akulian	Jason	Mercator MedSystems, Inc.		8/24/15	8/23/18	Broncho-Adventitial Delivery of Paclitaxel to Extend Airway Patency in Malignant Airway Obstruction Patients	\$16,100
Recruitment	Akulian	Jason	Chiltern International, Inc		9/1/16	9/30/18	A Pivotal Multi-Center, Randomized, Controlled, Single-Blinded Study Comparing the Silver Nitrate-Coated Indwelling Pleural Catheter (SNCIPQ) to the Uncoated PleurX® Pleural Catheter for the Management of Symptomatic, Recurrent, Malignant Pleural Obstruction	\$71,578
Recruitment	Akulian	Thomas	AbbVie, Inc.	M16-10683476/PO#420	11/7/17	9/30/20	A Phase 1 Dose Escalation, Open-Label Study of Venetoclax in Combination with Navitoclax and Chemotherapy in Subjects with Relapsed Acute Lymphoblastic Leukemia	\$15,510
Retention	Allbritton	Nancy	NIH National Cancer Institute	5-R01-CA177993-01-04	8/15/14	7/31/19	Single-Cell Measurement of Lipid Signaling in Colorectal Cancer	\$584,480
Retention	Allbritton	Nancy	NIH National Institute of Diabetes, Digestive, and Kidney Diseases	5-R01-DK109559-01-03	9/25/15	7/31/20	Development of Human Intestinal Simulacra	\$1,370,054
Retention	Allbritton	Nancy	NIH National Cancer Institute	5-F31-CA206233-02	6/1/16	4/23/18	FELLOW/M DISALVO High-Throughput Generation of Pancreatic Organoids with Controlled Stromal Milieus using Microcraft-Based Cell Sorting	\$34,866
Retention	Allbritton	Nancy	NIH National Cancer Institute	1-F31-CA2228223-01	4/1/18	3/31/20	A combined single cell gene expression and enzyme activity assay to study chemotherapy resistance in pancreatic ductal adenocarcinoma	\$35,681
Retention	Allbritton	Nancy	NIH National Cancer Institute	1-R01-CA224763-01A1	4/1/18	3/31/23	Profiling signaling activity and gene expression in single, pancreatic adenocarcinoma cells using CE-RNA-Seq	\$575,272
Retention	Allbritton	Nancy	Scripps Research Institute	5-27078	8/1/17	7/31/19	Development and Validation of a Genetically Engineered Model of Neurfibromatosis Type 2 to Facilitate Discovery of Neurotherapeutics	\$22,206
Recruitment	Amelio	Antonio	NIH National Institute of Dental and Craniofacial Research	1-F31-DE027282-01A1	3/1/18	2/28/20	FELLOW/AMUSICANT Role of CRTC1 /MAML2-Mediated Interactions with CREB and MYC in Defining the Cellular Heterogeneity of Salivary Tumors	\$34,124
Investment (Protocol)	Anders	Carey	Novartis Pharmaceuticals Corporation		8/1/11	12/31/17	LCCC 1025 A Phase II Study Evaluating The Efficacy And Tolerability Of Everolimus (RAD001) In Combination With Trastuzumab And Vinorelbine In The Treatment Of Progressive HER2-Positive Breast Cancer Brain Metastases	\$18,317
Investment (Protocol)	Anders	Carey	Merrimack Pharmaceuticals		5/1/15	5/1/25	A Pilot Study in Patients Treated with MM-358 to Determine Tumor Drug Levels and to Evaluate the Feasibility of Ferumoxytol Magnetic Resonance Imaging to Measure Tumor Associated Macrophages and to Predict Patient Response to Treatment	\$208,111
Investment (Protocol)	Anders	Carey	Merck Sharp and Dohme Corp.		12/21/15	6/19/18	A Phase II Clinical Trial of Pembrolizumab (MK-3475) as Monotherapy for Metastatic Triple-Negative Breast Cancer (mTNBC)	\$188,047
Investment (Protocol)	Anders	Carey	TESARO, Inc.	PO04461	11/15/16	11/15/18	Niraparib efficacy and pharmacodynamics in intracranial TNBC murine models	\$68,620
Investment (Protocol)	Anders	Carey	TESARO, Inc.		2/15/17	4/30/21	Phase 1/2 Trial of Niraparib in Combination with Pembrolizumab in Patients with Advanced or Metastatic Triple-Negative Breast Cancer and in Patients with Recurrent Radial Grial Development and Differentiation	\$92,273
Investment (Protocol)	Anders	Eva	NIH National Institute of Mental Health	5-R01-MH060929-17-19	12/1/99	5/31/20	Leukemia Specific Splice Isoforms as Neo-Antigens for T-Cell Immunotherapy	\$380,000
Investment (Protocol)	Anders	Paul	NIH National Cancer Institute	5-R01-CA201225-01-03	2/1/16	1/31/21	Leukemia Specific Splice Isoforms as Neo-Antigens for T-Cell Immunotherapy	\$441,729
Innovation Award	Armistead	Jeffrey	NIH National Cancer Institute	5-R01-CA201225-01-03	2/1/16	1/31/21	SBIR:Rapid Detection of Minimal Residual Disease in Acute Myeloid Leukemia from Peripheral Blood	\$49,080
Innovation Award	Armistead	Paul	BioFluidica, Inc.		3/1/17	2/28/19	STTR:CellRaft Array for Screening and Isolation of Highly Effective Cytotoxic T Cells	\$213,308
Innovation Award	Armistead	Paul	Cell Microsystems, Inc.		7/3/17	6/30/19	Intestinal inflammation and genotoxicity of the colonic-adherent microbiota	\$240,954
Recruitment	Arthur	Janelle	NIH National Institute of Diabetes, Digestive, and Kidney Diseases	5-R01-DK103952-01-04	9/17/14	8/31/19	Intestinal inflammation and genotoxicity of the colonic-adherent microbiota	\$151,681
Recruitment	Arthur	Janelle	Kenneth Rainin Foundation		2017-307	10/1/17	Bacterial siderophores and inflammatory bowel diseases (IBD)-associated fibrosis	\$100,000
Recruitment	Aube	Jeffrey	Cornell University Medical Campus		180185	7/1/15	Tri-institutional TB Research Unit: Persistence and Latency 1U19AI11143 - Chemistry	\$620,479
Recruitment	Aube	Jeff	University of Kansas Center for Research, Inc.		FY2016-020-M1	7/8/15	Molecular Cancer Therapy Targeting HuR ARE Interaction	\$80,817
Recruitment	Aube	Jeff	University of Kansas Center for Research, Inc.		FY2016-006	7/1/15	HTS to identify small molecules to disrupt abnormal huntingtin interactions in hdm	\$149,354
Recruitment	Aube	Jeff	Scripps Research Institute		5-27127	1/31/21	Novel Probes of the Kappa Opioid Receptor: Chemistry, Pharmacology, and Biology	\$180,865
Recruitment	Aube	Jeff	Scripps Research Institute		5-27127	1/31/21	Novel Probes of the Kappa Opioid Receptor: Chemistry, Pharmacology, and Biology	\$18,228
Recruitment	Aubé	Jeff	Fox Chase Cancer Center		FCCC15101-01	9/26/16	Identifying stabilizers of p53 using pocket complementarity	\$15,200

UCRF	Last Name	First Name	Sponsor	Number	Begin	End	Title	Total Cost \$
Retention	Bae-Jump	Victoria	American Cancer Society	RSG-15-138-01-CCE	1/1/16	12/31/19	Obesity, Cation-Selective Transporters and Metformin in Endometrial Cancer	\$198,000
Retention	Bae-Jump	Victoria	North Carolina Biotechnology Center	2015-CFG-8004	8/14/15	8/1/18	Discovery of Novel, Efficacious and Safe Biguanides for the Treatment of Ovarian Cancer	\$50,000
Retention	Bae-Jump	Victoria	V Foundation for Cancer Research	T2017-015	11/1/17	11/1/20	Metabolic and Molecular Biomarkers of Metformin Response in Obesity-driven Endometrial Cancer	\$200,000
Retention	Bae-Jump	Victoria	NIH National Cancer Institute	1-R21-CA220269-01	9/25/17	8/31/19	Inter-relationship between microbiota diversity, obesity and race in Endometrial Cancer	\$202,928
Retention	Bae-Jump	Victoria	NIH National Cancer Institute	1-R01-CA226969-01	3/14/18	2/28/23	Obesity-driven Metabolic and Molecular Biomarkers of Metformin Response in Endometrial Cancer	\$355,706
Investment	Baric	Ralph	NIH National Institute of Allergy and Infectious Diseases	5-R01-AI110700-01-04	4/20/15	3/31/20	Mechanisms of MERS-CoV Entry, Cross-species Transmission and Pathogenesis	\$727,370
Investment	Baric	Ralph	University of Alabama at Birmingham	000502793-005	3/1/15	2/28/19	Antiviral Drug Discovery and Development Center	\$462,644
Investment	Baric	Ralph	Columbia University	5(GG008377-39)	3/1/16	2/28/19	Diagnostic and Prognostic Biomarkers for Viral Severe Lung Disease	\$889,034
(CC)	Investment	Baric	NIH National Institute of Allergy and Infectious Diseases	5-U19-AI107810-05	6/21/13	5/31/19	Characterization of novel genes encoded by RNA and DNA viruses	\$2,021,134
Investment	Baric	Ralph	NIH National Institute of Allergy and Infectious Diseases	1-R01-AI132178-01	8/9/17	7/31/22	Broad-spectrum antiviral GS-5734 to treat MERS-CoV and related emerging CoV	\$1,455,240
Investment	Baric	Ralph	Vanderbilt University Medical Center	VUMC41666	3/1/18	2/28/19	Determinants of Coronavirus Fidelity in Replication and Pathogenesis	\$293,121
Investment	Baric	Ralph	University of Texas at Austin	UTA18-000140	2/1/18	1/31/20	Molecular Analysis of Serum Antibody Constituents in Zika Virus Infection	\$116,625
Investment	Baric	Ralph	NIH National Institute of Allergy and Infectious Diseases	HHSN27220180462P	3/5/18	3/4/19	Immunological Data for MERS-CoV vaccine and immunotherapeutic candidates	\$146,246
(CC)	Investment	Baric	University of Michigan	SUBK0008176	9/1/17	4/30/19	GLINE010 Validation and Comparison of Biomarkers for the Early Detection of Colorectal Adenocarcinoma	\$35,840
Recruitment	Baron	John	Mayo Clinic Patient-Centered Outcomes Research Institute	65507744 JNC194321-03	8/1/14	7/31/18	Alliance NCORP Research Base	\$70,283
