

CURRENT CLINICAL TRIALS – SCREENING

Comparing Two Methods to Follow Patients with Pancreatic Cysts

Clinical Trial Website: [NCT04239573](https://clinicaltrials.gov/ct2/show/study/NCT04239573)

Current Status: Recruiting

Design: Pancreatic cysts are commonly discovered during CTs or MRIs performed for other reasons. The cysts will often be monitored to ensure they don't change over the years. This multicenter study compares two different approaches for monitoring to see which leads to better outcomes. Participants will be randomized between either the high-intensity surveillance group with more frequent follow-up, or the low-intensity surveillance group. Both groups will be followed for 5 years.

Key Inclusion:

- Patients between the ages of 50 and 75
- Newly diagnosed pancreatic cyst greater than 1 cm on MRI or CT

Key Exclusion:

- Prior diagnosis of pancreatic cancer
- Chronic pancreatitis
- Family history of pancreatic cancer

PROMoting CLinical Trial EngagemEnt for Pancreatic Cancer App Study (PROCLAIM Study)

Clinical Trial Website: [NCT06252545](https://clinicaltrials.gov/ct2/show/study/NCT06252545)

Current Status: Recruiting

Description: This two-part, randomized trial seeks to identify and address barriers to enrollment of Black patients in pancreatic cancer clinical trials by conducting interviews and creating a culturally-informed mobile health application to promote participation.

Key Inclusion:

- Patients at least 18 years old
- Patients must identify as Black
- Have newly diagnosed or progressive pancreatic cancer
- Have access to a mobile device

Key Exclusion:

- Inability to read and speak English
- Dementia altered mental status or a psychiatric condition prohibiting informed consent
- Active participation in a therapeutic clinical trial
